Please find attached a copy of Amendment 1 to JAR-22, effective 1 August 2001.

In the past it has been the practice to publish the outcome of NPAs first as Orange Papers and subsequently introduce these NPAs into the JARs through a Change (a complete re-issue) to the JAR. Following a number of comments from users, developments in the area of office automation and to ensure that amendments are brought to the users in the fastest possible way, it has been decided to introduce a new method of publishing these amendments.

In the future amendments to JARs will be published through Amendments, or Replacement Pages, which can be inserted in the already existing JAR. This will mean that a current JAR can contain pages from several Amendments. We will however, always re-issue the checklist of pages, in order that the users can check the content of their JAR.

Also, on the back of this letter we have provided instructions on how to replace the pages.

We hope that you will find this to be an improvement to the JAA Publication System.

The Comment Response Documents to NPA-22B-31, NPA 22D-46, NPA 22D-64, NPA 22B-65, NPA 22E-68, and NPA 22G-69 is available on the JAA website.

Inge R Steenberg
Assistant to Regulation Director
JAR-22, Amendment 6, 1 August 2001

Please replace and insert the following pages included in this package as follows:

Cover (2 pages)
Contents (general layout) (pages C–1 / C–2)
Contents (details) (pages C–3 to C–10)
Foreword (pages F–1 / F–2)
Checklist (pages CL–1 to CL–4)
Preamble (pages P–1 to P–8)

Section 1
Replace Subpart B (pages B1 to B12)
Replace Subpart D, (pages D1 to D12)
Replace Subpart E (pages E1 to E8)
Replace Subpart F (pages F1 to F4)
Replace Subpart G (pages G1 to G8)
Replace Subpart J (pages J1 to J2)
Insert Appendix J (pages J1 to J2)

Amendment 6
1 August 2001

All rights reserved

Printed and distributed by Global Engineering Documents, 15 Inverness Way East, Englewood, Colorado 80112, U S A on behalf of the Joint Aviation Authorities Committee.
The members of the Joint Aviation Authorities Committee are representatives of the Civil Aviation Authorities of the countries that have signed the ‘Arrangements Concerning the Development and the Acceptance of Joint Airworthiness Requirements’. A list of these countries is kept by European Civil Aviation Conference (ECAC), 3 bis Villa Emile Bergerat 92522, Neuilly-Sur-Seine, Cedex, France.*

[ Further printed copies of the Joint Aviation Authorities Documents can be purchased from Global Engineering Documents, whose world wide offices are listed on the JAA website (www.jaa.nl) and Global website (www.global.ihs.com).

For electronic versions of Joint Aviation Authorities Documents please refer to the website of Information Handling Services (IHS) on www.ihsaviation.com, where you will find information on how to order.

Enquiries regarding the contents should be addressed to the Central JAA, Saturnusstraat 10, PO Box 3000, 2130 KA Hoofddorp, Netherlands. ]

* These countries are:
[Austria, Belgium, Bulgaria, Cyprus, Czech Republic, Denmark, Estonia, Finland, The Former Yugoslav Republic of Macedonia, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Moldova, Monaco, Netherlands, Norway, Poland, Portugal, Romania, Slovak Republic, Slovenia, Spain, Sweden, Switzerland, Turkey & United Kingdom.]

Appendix G – Cockpit placards

Appendix H – Specimen Flight Manual for a sailplane (including a powered sailplane)

Appendix I – Self-sustaining powered sailplanes

[Appendix J – Process of H-Point Determination]
FOREWORD

1 GENERAL

1.1 The Airworthiness Authorities of certain European countries signed a document entitled 'Arrangements Concerning the Development and Acceptance of Joint Airworthiness Requirements' on 20th/21st March 1979 under which they agree to co-operate in agreeing common comprehensive airworthiness requirements (referred to as the Joint Aviation Requirements (JAR)) with a view to minimizing Type Certification problems on joint ventures, and also to facilitate the export and import of aviation products.

1.2 The participating Authorities agree to recognise the JAR as an acceptable basis for showing compliance with their national airworthiness codes, except in a limited number of cases where one or more Participating Authorities have declared National Variants. Some of the Participating Authorities have adopted Parts of the JAR as their only national requirements for the relevant product.

1.3 It is accepted that, except where National Variants have been declared, there is an interpretation of JAR requirements which provides equivalence with national codes as currently interpreted.

1.4 Definitions and abbreviations of terms used in this JAR–22 are contained in JAR–1, Definitions and Abbreviations.

2 SAILPLANES AND POWERED SAILPLANES

2.1 This JAR for Sailplanes and Powered Sailplanes has been based on a national airworthiness code (Luftüchtigkeitsforderungen für Segelflugzeuge und Motorsegler (LFSM), published by Luftfahrt Bundesamt). During the discussion leading to agreement to this JAR–22, it was agreed that an FAR type of presentation should be used and this document shows the complete text in that form.

2.2 Certain of the requirements of this JAR–22, in particular those in Subpart F, call for the installation of equipment. These requirements, in common with the remainder of JAR–22, are intended to be acceptable to all Participating Authorities as showing compliance with their National Code for type certification purposes. However, it should be borne in mind that, for operational purposes, the Authority of an importing country may require equipment additional to that prescribed in this JAR.

2.3 The technical requirements of this JAR–22 are issued with the understanding that it is assumed that National Regulations will cover grounds on which additional requirements will be applied (e.g. for unconventional design features) and the acceptance of equivalent safety in the case of non-compliance with one or several requirements.

3 PRESENTATION

3.1 The requirements of JAR–22 are presented in two columns on loose pages, each page being identified by the date of issue or the Change number under which it was amended or reissued.

3.2 Requirements. Requirements are printed in an upright typeface.

3.3 A numbering system has been used in which the Acceptable Means of Compliance or Interpretative/Explanatory Material uses the same number as the JAR paragraph to which it refers. The number is introduced by the letters AMC or IEM to distinguish the material from the JAR itself.

3.4 The acronyms AMC and IEM also indicate the nature of the material and for this purpose the two types of material are defined as follows:
Acceptable Means of Compliance (AMC) illustrate a means, or several alternative means, but not necessarily the only possible means by which a requirement can be met. It should however be noted that where a new AMC is developed, any such AMC (which may be additional to an existing AMC) will be amended into the document following consultation under the NPA procedure.

Interpretative/Explanatory Material (IEM) helps to illustrate the meaning of a requirement.

3.5 National Variants. National Variants are requirements and AMC/IEMs stated to be applicable by individual countries, and they appear in the text prefaced by a letter indicating the country that has stated the National Variant. National Variants are printed either in upright or italic typeface, depending on whether they relate to requirements or AMC/IEMs and are contained within boxes, and appear immediately below the paragraphs to which they relate.

3.6 Powered Sailplanes. Requirements and AMC/IEMs with no marginal annotation are applicable to sailplanes and to powered sailplanes. Requirements and AMC/IEMs (or portions thereof) which are applicable only to powered sailplanes are marked (except in Subpart E, Power-plant) in the margin beside them by line and the letter P.

3.7 Amendment. Subsequent to the first issue of the JAR, all amendments to current text, and new text, will be enclosed within heavy brackets. Paragraphs and sub-paragraphs the texts of which are deleted by amendment, will be marked 'Reserved' beside the number.

[3.8 Amendments to the text of this JAR–22 are issued as Replacement pages. These show an effective date and have the same status and applicability as JAR–22 from that date.]

[3.9 Amendment Status. Following amended paragraphs, a summary of the amendments made to the paragraph is indicated in square brackets. This text has no regulatory status.]

</table>
This JAR–22 was issued on 1st April 1980 and became effective on that date.

Amendment 1 Effective: 18.5.81

The purpose of this amendment is to take into account the following:–

(a) An amendment to ACJ 22.3 and deletion of the Note to that ACJ, arising from NPA 22B–1.
(b) An additional requirement in JAR 22.143(b) relating to powered sailplanes, arising from NPA 22B–2.
(c) An additional requirement in JAR 22.143(c) relating to powered sailplanes, arising from NPA 22B–2.
(d) The deletion of the Note following the Table in JAR 22.143(c), arising from NPA 22B–2.
(e) Deletion of the words ‘or climb’ from JAR 22.145(c)(1), arising from NPA 22B–1.
(f) An additional requirement in JAR 22.181 relating to powered sailplanes, arising from NPA 22B–1.
(g) An amendment to JAR 22.201 (e) to show clearly that the paragraph relates to a winch-launching case.
(h) An amendment to JAR 22.201 (f) to detail the sub-paragraphs of JAR 22.201 with which compliance must be shown under the conditions of JAR 22.201(f), arising from NPA 22B–2.
(i) An additional requirement in JAR 22.203 relating to powered sailplanes, arising from NPA 22B–2.
(j) An additional parameter of 0.2 $V_{SO}$ in JAR 22.233(a), arising from NPA 22B–2.
(k) An amendment to JAR 22.251, arising from NPA 22B–2.
(l) A new ACJ to JAR 22.255(a) relating to powered sailplanes, arising from NPA 22B–2.
(m) A correction to JAR 22.335(f).
(n) An amendment to JAR 22.425, arising from NPA 22C–3.
(o) A correction to JAR 22.779.
(p) A cross-reference to Subpart H in JAR 22.903(a).
(q) A cross-reference to Subpart J in JAR 22.905.
(r) The introduction of Subpart H, Engines.
(s) The introduction of Subpart J, Propellers.

Amendment 2 Effective: 13.9.82

The purpose of this amendment is to take into account the following:–

(a) The introduction of NPA 22A–4, which extends paragraph JAR 22.1 (a)(2) to agree with the wording of JAR 22.1801.
(b) The introduction of NPA 22B–5, which revises the value of $V_{SO}$ in JAR 22.49(b) and amends paragraph JAR 22.1(a)(2).
Amendment 3
Effective: 31.1.83

The purpose of this amendment is to take into account the following:

(a) The introduction of NPA 22C–6, which:

(i) corrects the signs in the ‘Load Factor Increment’ column in the table of Category A – Additional Cases on page C–8; and

(ii) indicates manoeuvring load factors \( n_1 \) to \( n_4 \) in Figure 1, Manoeuvring Envelope, referred to in paragraph JAR 22.333(b).

Change 4
Effective Dates:

Amendment 22/84/1  14.12.84
Amendment 22/85/1  12.12.85
Amendment 22/86/1  22.10.86

The purpose of this Change, published on 7th May, 1987, is to introduce the amendments detailed in Orange Paper Amendments 22/84/1, 22/85/1 and 22/86/1 (which are hereby cancelled) and to incorporate other miscellaneous revisions also listed below.

Title Page
Addition of the words ‘Change 4 7th May, 1987’ on the title page. Amendment of the JAR Secretariat address on the back of the title page.

Contents
Revision of Contents list to include Appendix H.

Foreword
Introduction of new paragraph 1.4, stating where definitions and abbreviations can be found.

Subpart A
Editorial amendment to JAR 22.1 (a)(2) to clarify the text. Withdrawal of the Netherlands National Variant for JAR 22.3(a), arising from NPA 22A, D–15.

Subpart B
Amendments to JAR 22.49(b) and (d), introducing revised text, arising from NPA 22B–28.

Amendment to JAR 22.143(c), inserting words to clarify the table, arising from NPA 22B, C, D–12.

Amendment to JAR 22.145(c)(1) and (c)(3), introducing revised text, arising from NPA 25B, C, G–21.

Amendment to JAR 22.147, inserting words to clarify the text, arising from NPA 22B, C, G–21.

Amendment to JAR 22.155, inserting words to clarify the text, arising from NPA 22B, C, G–21.

Amendment to JAR 22.161 (b)(1) and (b)(2), inserting words to clarify the text, arising from NPA 22B, C, G–21.

Amendment to JAR 22.161 (c)(2)(i), re-defining the speed range, arising from NPA 22B, C, E, G–22.

Amendment to ACJ 22.173(b), paragraph (2)(a), inserting a cross-reference to another ACJ, arising from NPA 22C–17.
Amendment to JAR 22.175(c)(1), re-defining the speed range, arising from NPA 22B–11.

Amendment to JAR 22.175(c)(6), inserting words to clarify the text, arising from NPA 22B, C, E, G–22.

Amendment to JAR 22.175(d)(3), inserting words to clarify the text, arising from NPA 22B–10.

Amendment to JAR 22.175(d)(6), inserting words to clarify the text, arising from NPA 22B, C, E, G–22.

Amendment to ACJ 22.175, paragraph (2), inserting a cross-reference to another ACJ, arising from NPA 22C–17.

Amendment to JAR 22.201(f), revising the cross-references, arising from NPA 22B–23.

Introduction of new sub-paragraph JAR 22.201(g), arising from NPA 22B–23.

Amendment to JAR 22.203, introducing additional new text into sub-paragraph (a) and deleting text from sub-paragraph (b), arising from NPA 22B–10.

Amendment to JAR 22.207(a), introducing additional new text, arising from NPA 22B–10.

Withdrawal of the Belgian, French, Netherlands and United Kingdom National Variants for JAR 22.207(b), arising from NPA 22B–14.

Introduction of new ACJ 22.207(b), arising from NPA 22B–14.

Amendment to JAR 22.221(b), inserting a cross-reference to an ACJ, arising from NPA 22C–17.

Amendment to JAR 22.221(c), introducing additional new text, arising from NPA 22B–8.

**Subpart C**

Introduction of new ACJ 22.335, arising from NPA 22C–17.

Amendment to JAR 22.345(b)(1), inserting words to clarify the text, arising from NPA 22B, C, G–21.

Amendment to JAR 22.395, introducing revised text into sub-paragraph (a) and a new sub-paragraph (b), arising from NPA 22C–24.

Amendment to JAR 22.397(a), inserting words to clarify the text, arising from NPA 22C–24.

Amendment to JAR 22.411(a), introducing revised text and a new ACJ 22.411(a), arising from NPA 22C–7.

Amendment to ACJ 22.423, revising the formula, re-defining the units of one symbol and defining three new symbols, arising from NPA 22C–25.

Amendment to JAR 22.425, re-defining the units of two symbols, arising from NPA 22C–25.

Amendment to JAR 22.427, reprinting text in upright type, arising from NPA 22B, C, E, G–22.

Amendment to JAR 22.443(b), re-defining the units of one symbol, arising from NPA 22C–25.

Editorial amendment to JAR 22.477, revising a cross-reference.

Amendment to ACJ 22.477, paragraph (1), introducing revised text, arising from NPA 22C–20.

Amendment to JAR 22.479, introducing revised text, arising from NPA 22C–20.

Amendment to JAR 22.481, introducing an editorial correction to the text and revising the formula, arising from NPA 22C–25.

Amendment to JAR 22.501, inserting words to clarify the text, arising from NPA 22C–20.

Amendment to JAR 22.591, introducing revised text, arising from NPA 22B, C, D–12.

Amendment to JAR 22.593, introducing revised text, arising from NPA 22B, C, E, G–22.

Subpart D
Introduction of new ACJ 22.685(d), arising from NPA 22D–9.

Amendment to JAR 22.697(a), inserting a word to clarify the text.

Withdrawal of the Netherlands National Variant for JAR 22.697(c), arising from NPA 22A, D–15.

Deletion of JAR 22.711(h), arising from NPA 22B, C, D–12.

Amendment to JAR 22.725, revising the title, arising from NPA 22C–20.

Amendment to JAR 22.777(d), introducing additional new text, arising from NPA 22B, C, D–12.

Amendment to JAR 22.785(a), introducing additional new text, arising from NPA 22B, C, D–12.

Amendment to JAR 22.786(b), introducing revised text, arising from NPA 22B, C, D–12.

Subpart E
Deletion of JAR 22.901(c), arising from NPA 22B, C, D–12.

Amendment to JAR 22.925(a), inserting words to clarify the text, arising from NPA 22B, C, E, G–22.

Amendment to JAR 22.1103(a), inserting words to clarify the text, arising from NPA 22B, C, E, G–22.

Subpart G
Editorial correction to JAR 22.1501 (a), revising a cross-reference.

Amendment to JAR 22.1505(b), re-defining the speed, arising from NPA 22G–13.

Withdrawal of the Netherlands National Variant for JAR 22.1505(b), arising from NPA 22G–13.

Amendment to JAR 22.1511, inserting a cross-reference to an ACJ, arising from NPA 22C–11.

Amendment to JAR 22.1529, inserting a new sub-paragraph (g) and re-numbering the subsequent paragraphs, arising from NPA 22C–7.
Amendment to JAR 22.1545(c), inserting a word and cross-reference to an ACJ, arising from NPA 22B, C, G–21.

Amendment to JAR 22.1545(e), inserting words to clarify the text, arising from NPA 22B, C, E, G–22.

Editorial amendment to the caption of Figure 1 to clarify that the Figure is an example of airspeed indicator markings.

Withdrawal of the German National Variant for JAR 22.1557(e), arising from NPA 22G–16.

Introduction of new ACJ 22.1581, arising from NPA 22G–27.

Appendix H

Change 5 28.10.95 Amendment 22/90/1 30.06.90 Amendment 22/91/1 09.12.91 Amendment 22/94/1 10.11.94

The purpose of this Change, published on 28 October, 1995, is to introduce the amendments detailed in Orange Paper Amendments 22/90/1, 22/91/1 and 22/94/1 (which are hereby cancelled) and to incorporate NPA 22D–66, as indicated below:

Foreword
Editorial Amendments to reflect the use of AMC and IEM as titles in place of ACJ and AMJ.

N.B.: All ACJs in JAR–22 have been relabelled as either AMC or IEM.

Subpart A
Amendment of text of JAR 22.1(b) arising from NPA 22A, B, G–18.

Inclusion of a new JAR 22.1(d) arising from NPA 22A, B, G–18.

Subpart B
Amendment of text to JAR 22.49(b) arising from NPA 22B–38.

Amendment to text of JAR 22.51 arising from NPA 22B–53.

Amendment to text of JAR 22.65(a) arising from NPA 22B–63.

Deletion of Dutch National Variant (N) JAR 22.65(a) arising from NPA 22B–63.

Inclusion of JAR 22.65(b) arising from NPA 22A, B, G–18.

Amendment of text to JAR 22.73 arising from NPA 22B–50.

Amendment of text to JAR 22.145(c)(2) arising from NPA 22B–52.

Inclusion of IEM 22.173(a)(1) arising from NPA 22B–47.
Amendment of text to JAR 22.173(a)(2) arising from NPA 22B–47.

Amendment of \(V_S\) to read \(V_{S1}\) in JAR 22.175(b)(1) arising from NPA 22B–47.

Amendment of text to JAR 22.221 arising from NPA 22B–34.

Amendment of text to AMC 22.221(c) to (g) arising from NPA 22B–34.

**Subpart C**

Correction of \(V_S\) to \(V_{S1}\) in JAR 22.335(b)(1)(i).

Amendment of text to JAR 22.335(b)(2)(i) arising from NPA 22C–44.

Inclusion of JAR 22.375 arising from NPA 22C–42.

Inclusion of IEM 22.375(a) arising from NPA 22C–42.

Amendment of text to JAR 22.447(a) arising from NPA 22C–39.

Inclusion of IEM 22.447(a) arising from NPA 22C–39.

**Subpart D**

Amendment of text to JAR 22.611 arising from NPA 22D–54.

Inclusion of IEM 22.611 arising from NPA 22D–54.

Deletion of UK National Variant (G) JAR 22.697(c) arising from NPA 22D–32.

Inclusion of JAR 22.713 arising from NPA 22D–35.

Inclusion of IEM 22.777(a) arising from NPA 22D–55.

Amendment to text of JAR 22.777(b) arising from NPA 22D–43 and then again by D–55.

Inclusion of IEM 22.777(b) arising from NPA 22D–55.

Inclusion of new items into table in JAR 22.779 arising from NPA 22D–30 & –56.

Inclusion of IEM 22.780 arising from NPA 22D–30.

Amendment of text to JAR 22.781 arising from NPA 22D–43.

Amendment of text to JAR 22.807(b) arising from NPA 22D–30.

Inclusion of new JAR 22.807(d) arising from NPA 22D–30, causing existing (d) to be renumbered as (e).

Deletion of Dutch National Variant in JAR 22.821, arising from NPA 22D–66.
**Subpart E**
Inclusion of JAR 22.969 arising from NPA 22E–33.
Amendment of text to JAR 22.973 arising from NPA 22A, B, G–18.
Amendment of text to JAR 22.975 arising from NPA 22E–33.

**Subpart F**
Inclusion of JAR 22.1322 arising from NPA 22F–61.
Inclusion of JAR 22.1365(c) arising from NPA 22F–37.
Inclusion of AMC 22.1365(c) arising from NPA 22F–37.

**Subpart G**
Inclusion of JAR 22.1513 arising from NPA 22G–36.
Inclusion of JAR 22.1523 arising from NPA 22D–55.
Amendment of text to JAR 22.1545(a) arising from NPA 22G–57.
Inclusion of AMC 22.1545(a) arising from NPA 22G–57.
Amendment of text to JAR 22.1549(d) arising from NPA 22G–45.
Inclusion of IEM 22.1549(d) arising from NPA 22G–45.
Deletion of UK National Variant (G) JAR 22.1557 arising from NPA 22G–62.
Inclusion of JAR 22.1559(e) arising from NPA 22G–36.
Amendment of text to JAR 22.1581 arising from NPA 22G–19.
Inclusion of AMC 22.1581 arising from NPA 22G–19.
Amendment of text to, and inclusion of new sub-paragraphs to JAR 22.1585 arising from NPA 22A, B, G–18, G–19 and G–59.
Inclusion of AMC 22.1585(f) arising from NPA 22G–59.
Inclusion of JAR 22.1587 arising from NPA 22G–19.
Inclusion of JAR 22.1589 arising from NPA 22G–19.

**Appendix H**
Amendment of text to and layout of Appendix H arising from NPA 22AppH–40.
Correction to Appendix H, 6.1

**Appendix I**
Inclusion of Appendix I arising from NPA 22A, B, G–18.
JAR-22

Amendment 6 01.08.01

The purpose of this Amendment, published on 1 August 2001, is to introduce NPAs 22B-31, 22D-46, 22D-64, 22B-65, 22E-68, and 22G-69.

Title Page
Amendment of the status of JAR-22. Amendment of the publisher name and address and amendments on front and verso page. Amendments to the list of JAA Member States on the verso page.

Contents
Revision of Contents list to include JAR 22.788, arising from NPA 22D-64

Revision of Contents list to include Appendix J.

Foreword
Amendment to paragraph 3.8 on publication of amendments to JAR-22.

Introduction of paragraph 3.9 on Amendment status of JAR-22 paragraphs.

Subpart B
Amendment to JAR 22.51(a), arising from NPA 22B-65.

Amendment to JAR 22.207(a), arising from NPA 22B-31.

Amendment to JAR 22.207(d), arising from NPA 22B-31.

Subpart D
Amendment to JAR 22.785(e), arising from NPA 22D-46.

Introduction of JAR 22.785(f), arising from NPA 22D-46.

Introduction of IEM 22.785(f), arising from NPA 22D-46.

Introduction of JAR 22.788, arising from NPA 22D-64.

Introduction of IEM 22.788, arising from NPA 22D-64.

Subpart E
Amendment to JAR 22.1149(a), arising from NPA 22E-68.

Subpart F
Deletion of Belgian and French National Variant in JAR 22.1303(a).

Introduction of JAR 22.1305(h), arising from NPA 22E-68.

Subpart G
Introduction of JAR 22.1521(b)(4), arising from NPA 22E-68.

Renumbering and renaming of JAR 22.1563, arising from NPA 22G-69.

Introduction of JAR 22.1585(k), arising from NPA 22D-64.

Amendment to JAR 22.1587(c), arising from NPA 22B-65.

Subpart J
Amendment to JAR 22.1923, arising from NPA 22E-68.

Appendix J
Introduction of Appendix J, arising from NPA 22D-46.
JAR 22.1  Applicability

(a) This JAR–22 prescribes minimum airworthiness standards for the issue of type certificates, and changes to those certificates, for sailplanes and powered sailplanes in the utility U and aerobatic A categories:

(1) sailplanes the maximum weight of which does not exceed 750 kg;

(2) single engined (spark- or compression-ignition) powered sailplanes the design value \(W/b^2\) (weight to span\(^2\)) of which is not greater than \(3(W[kg], b[m])\) and the maximum weight of which does not exceed 850 kg; and

(3) sailplanes and powered sailplanes the number of occupants of which does not exceed two.

(b) Each person who applies for such a certificate or change must show compliance with the applicable requirements of this Part, except as provided in sub-paragraph (d).

(c) Those requirements in this JAR–22 which apply only to powered sailplanes are marginally annotated with the letter P. Requirements not so marked apply both to sailplanes and to powered sailplanes with engines stopped and engine or propeller retracted where appropriate. In these requirements the word ‘sailplane’ means both ‘sailplane’ and ‘powered sailplane’.

(d) Unless specifically stated otherwise, the term ‘powered sailplane’ includes those powered sailplanes which may be incapable of complying with JAR 22.51 and/or JAR 22.65(a) and which must consequently be prohibited from taking off solely by means of their own power by a limitation in the Flight Manual. These are referred to in the text as ‘Self-Sustaining Powered Sailplanes’. For Self-Sustaining Powered Sailplanes the additional requirements in Appendix I are applicable.

JAR 22.3  Sailplane categories

(a) The Utility Category is limited to sailplanes intended for normal soaring flight. The following aerobatic manoeuvres may be permitted if demonstrated during type certification –

(1) spins;

(2) lazy eights, chandelles, stall turns and steep turns;

(3) positive loops.

(b) Sailplanes intended for aerobatic manoeuvres additional to those permitted in the Utility Category must be certificated in the Aerobatic Category. The permitted aerobatic manoeuvres must be established during type certification.

(c) Sailplanes may be certified in more than one category if the requirements of each requested category are met.

IEM 22.1(a)

JAR–22 is not applicable to aeroplanes classified as hang-gliders and ultralights or microlights. The definitions of these aeroplanes differ from country to country. However, hang-gliders can be broadly defined as sailplanes that can take-off and land by using the pilot’s muscular energy and potential energy.

Ultralights or microlights can be described as very low-energy aeroplanes, as some of their main characteristics are strictly limited. The following criteria are often used (alone or in combination): stalling speed, weight to surface ratio, maximum take-off weight, maximum empty weight, fuel quantity, number of seats.

In addition, both hang-gliders and ultralights/microlights are usually not type-certificated, and JAR–22 prescribes minimum standards for the issue of type certificates. This latter interpretation could also apply to aeroplanes having restricted certificate of airworthiness – JAR–22 is not applicable to such aeroplanes.

IEM 22.3

(1) Sailplanes may be used for cloud flying if permitted by national regulations if the equipment specified therein is installed and if they comply with JAR 22.73 (a).

(2) See Appendix F, Glossary of Aerobatic Manoeuvres.

GENERAL

JAR 22.21 Proof of compliance

(a) Each requirement of this Subpart must be met at each appropriate combination of weight and c.g. within the range of loading conditions for which certification is requested. This must be shown:

(1) by test upon a sailplane of the type for which certification is requested or by calculations based on and equal in accuracy to the result of testing; and,

(2) by systematic investigation of each critical combination of weight and c.g.

(b) Compliance must be established for all configurations (such as position of air brakes, wing-flaps, landing gear etc.) at which the sailplane will be operated except as otherwise stated. In demonstrating compliance, the power-plant or propeller, if retractable, must be retracted, except as otherwise stated.

NOTE: Flight tests required in this Subpart B do not constitute all the flight testing necessary to show compliance with JAR–22.

IEM 22.21

(1) Instrumentation for flight test

(a) For test purposes the sailplane should be equipped with suitable instruments for conducting the required measurements and observations in a simple manner. If reliable results cannot be obtained otherwise, the Authorities may request the installation of special test equipment.

(b) At an early stage in the programme the accuracy of the instruments and their correction curves should be determined, and particular attention should be paid to the position error of the air-speed indication system; the influence of the configuration of the sailplane should also be accounted for.

(2) Prior to flight test, the following ground tests should be conducted:

(a) Measurement of:

(i) control circuit stiffness;

(ii) friction of controls;

(iii) control cable tension of closed control circuits; and

(iv) maximum deflection of control surfaces and wing-flaps.

(3) Functioning tests. Before starting the flight tests all ground functioning tests should be carried out; especially the functioning of the towing hook should be tested in operation for all cable angles and forces which may occur.

JAR 22.23 Load distribution limits

(a) The ranges of weight and c.g. within which the sailplane may be safely operated must be established. Compliance must be shown over a c.g. range between the foremost limit of the c.g. and 1% of the standard mean chord or 10 mm, whichever is greater, aft of the aftmost limit of the c.g.

(b) The c.g. range must not be less than that which corresponds to the weight of each occupant, including parachute, varying between 110 kg and 70 kg, without the use of ballast as defined in JAR 22.31(c).

JAR 22.25 Weight limits

(a) Maximum weight. The maximum weight must be established so that it is:

(1) Not more than:

(i) the highest weight selected by the applicant;

(ii) the design maximum weight, which is the highest weight at which compliance with each applicable structural loading condition of this Part is shown; or

(iii) the highest weight at which compliance with each applicable flight requirement of this Part is shown.

(2) Not less than the weight which results from the empty weight of the sailplane, plus a weight of occupant(s) and parachute(s) of 110 kg for a single seat sailplane or 180 kg for a two seat sailplane, plus the required minimum equipment, plus any expendable ballast and for a powered sailplane sufficient fuel for at least half an hour of flight at maximum continuous power.

(b) The minimum weight must be established so that it is not more than the sum of:
(1) the empty weight determined under JAR 22.29; and

(2) a weight of occupant and parachute of 55 kg, plus any ballast as defined in JAR 22.31(c).

JAR 22.29 Empty weight and corresponding c.g.

(a) The empty weight and corresponding c.g. must be determined by weighing the sailplane:

(1) with:

(i) fixed ballast;

(ii) required minimum equipment;

(iii) for a powered sailplane, unusable fuel, maximum oil and, where appropriate, engine coolant and hydraulic fluid.

(2) excluding:

(i) weight of occupant(s) and parachute(s);

(ii) other readily removable items of load.

(b) The condition of the sailplane at the time of determining empty weight must be one that is well defined and easily repeated.

JAR 22.31 Ballast

There are three types of ballast:

(a) fixed ballast intended for correcting a deficiency in the sailplane’s balance;

(b) expendable ballast which can be jettisoned in flight and which serves to increase the weight and consequently the speed of the sailplane; and

(c) removable ballast used to supplement the weight of an occupant and parachute (when lower than 70 kg) in order to keep the c.g. position within limits. This ballast can be adjusted before, but not during, flight.

PERFORMANCE

JAR 22.45 General

Compliance with performance requirements of this Subpart must be shown for still-air in standard atmosphere and at sea-level.

JAR 22.49 Stalling speed

(a) $V_{So}$ is the stalling speed (CAS), if obtainable, or the minimum steady speed at which the sailplane is controllable, with:

(1) landing gear extended;

(2) wing-flaps in the landing position;

(3) air brakes retracted or extended whichever position results in the lowest value of $V_{So}$;

(4) maximum weight; and

(5) c.g. in the most unfavourable position within the allowable range.

(6) For a powered sailplane:

(i) the engine idling (throttle closed);

(ii) propeller in the take-off position;

(iii) cowl flaps closed.

(b) The stalling speed in the landing configuration must not exceed:

(1) 80 km/h with:

(i) air brakes retracted; and

(ii) maximum weight with water ballast tanks empty.

(2) 90 km/h with:

(i) air brakes retracted or extended, whichever position results in the highest value of the stalling speed; and at

(ii) maximum weight with water ballast.

(c) $V_{S1}$ is the stalling speed (CAS), if obtainable, or the minimum steady speed at which the sailplane is controllable with the:

(1) sailplane in the configuration existing in the test in which $V_{S1}$ is being used; and
(2) weight used when $V_{S1}$ is being used as a factor to determine compliance with a required performance standard.

(3) For a powered sailplane:
   (i) the engine idling (throttle closed);
   (ii) propeller in the take-off position;
   (iii) cowl flaps closed.

(d) Reserved.

(e) $V_{S0}$ and $V_{S1}$ must be determined by flight tests using the procedure specified in JAR 22.201.

[Ch. 2, 13.9.82; Ch. 5, 28.10.95]

---

**JAR 22.51 Take-off**

(a) For a powered sailplane the take-off distance at maximum weight and in zero wind, from rest to attaining a height of 15 m must be determined and must not exceed 500 m when taking off from a dry, level, hard surface. In demonstration of the take-off distance, the powered sailplane must be allowed to reach the selected speed promptly after lifting off and this speed must be maintained throughout the climb.

(b) The selected speed must not be less than:
   (1) $1.3 \cdot V_{S1}$, or
   (2) any lesser speed, not less than $1.15 \cdot V_{S1}$, that is shown to be safe under all reasonably expected operating conditions, including turbulence and complete engine failure.

[Ch. 5, 28.10.95; Amdt. 6, 01.08.01]

---

**JAR 22.65 Climb**

(a) For a powered sailplane the time for climb from leaving the ground up to 360 m above the field must not exceed four minutes with:
   (1) not more than take-off power;
   (2) landing gear retracted;
   (3) wing-flaps in take-off position;
   (4) cowl flaps (if any) in the position used in the cooling tests.

[Ch. 5, 28.10.95; Amdt. 6, 01.08.01]

---

**JAR 22.71 Rate of descent**

For a powered sailplane the smallest rate of descent in power-off configuration at maximum weight and most unfavourable c.g. position must not exceed the following limits:

(a) with a single-seater powered sailplane, 1.0 m/s;
(b) with a two-seater powered sailplane, 1.2 m/s.

[Ch. 5, 28.10.95]

---

**JAR 22.73 Descent, high speed**

It must be shown that the sailplane with the airbrakes extended, will not exceed $V_{NE}$ in a dive at an angle to the horizon of:

(a) $45^\circ$ when the sailplane is approved for cloud flying and/or aerobatics when certificated in the Aerobatic or Utility Category;
(b) $30^\circ$ in other cases.

[Ch. 5, 28.10.95]

---

**JAR 22.75 Descent, approach**

It must be shown that the sailplane has a glide slope not flatter than one in seven at a speed of $1.3 \cdot V_{S0}$ with air brakes extended at maximum weight.

---

**CONTROLLABILITY AND MANOEUVRABILITY**

**JAR 22.143 General**

(a) It must be possible to make a smooth transition from one flight condition to another (including turns and slips) without exceptional piloting skill, alertness or strength, and without danger of exceeding the limit load factor, under any probable operating condition, and, additionally, in the case of a powered sailplane, with the engine running at all allowable power settings.

(b) Any unusual flying characteristics observed during the flight tests required to determine compliance with the flight
requirements and any significant variations in flight characteristics caused by rain must be determined. In the case of a powered sailplane this requirement must be met with the engine running at all allowable powers.

IEM 22.143(b)

The characteristics to be noted should include stalling speeds and stalling behaviour.

(c) If marginal conditions exist with regard to required pilot strength, the ‘strength of pilots’ limits must be shown by quantitative tests. In no case may the limits exceed those prescribed in the following table. In the case of a powered sailplane this requirement must be met with the engine running at all allowable powers.

[J. 1, 18.5.81; Ch. 4, 7.5.87; Ch. 5, 28.10.95]

JAR 22.147 Lateral and directional control

Using an appropriate combination of controls it must be possible to reverse the direction of a turn with a 45° bank in the opposite direction within b/3 seconds (b is the span in metres) when the turns are made at a speed of 1.4 V_{S1} with wing-flaps in the most positive en-route position, air brakes and, where applicable, landing gear retracted and without significant slip or skid.

[J. 4, 7.5.87]

JAR 22.151 Aerotowing

(a) If the sailplane is equipped for aerotowing, aerotows must be demonstrated at speeds up to V_T without:

(1) excessive control forces and displacements for maintaining the wings at zero bank angle and in keeping a steady flight path;

(2) control forces exceeding those given in JAR 22.143 at speeds up to V_T;

(3) difficulty being experienced in regaining normal towing position after the sailplane has been displaced laterally or vertically; and

(4) any possibility, at the release, of the cable end or ends catching onto any part of the sailplane.
(b) Tests must be carried out with crosswind components not less than 0·2 $V_{S0}$ or 15 km/h, whichever is the greater.

(c) Compliance with the following requirements must be shown:

(1) With the sailplane on tow in the normal towing position it must be displaced laterally relative to the towing aircraft by the use of rudder and aileron, to give an initial disturbance in bank of 30°. The pilot must then be able to regain the normal towing position without exceptional piloting skill.

(2) The sailplane must be flown in a high towing position (approximately 15° above the flight path of the towing aircraft), and also in a low towing position (below the wake of the towing aircraft). In each case the pilot must be able to regain the normal towing position without exceptional piloting skill.

(d) A suitable range of cable lengths must be determined.

(e) Tests must be repeated for each location of the towing release mechanism and each configuration for which certification for aerotowing is requested.

JAR 22.152 Winch-launching and auto-tow launching

(a) If the sailplane is equipped for winch-launching, or auto-tow launching, such launches must be demonstrated at speeds up to $V_W$, without:

(1) difficulty being experienced in maintaining the wings at zero bank angle when leaving the ground and in effecting a release;

(2) control forces exceeding those given in JAR 22.143 or excessive control displacements;

(3) excessive pitching oscillation;

(4) push forces during the climb. If a trimming device is fitted, the position used during the climb must be stated.

(b) Tests must be carried out with crosswind components not less than 0·2 $V_{S0}$ or 15 km/h, whichever is the greater.

(c) Tests must be made for each location and arrangement of the release mechanism and for each configuration for which certification for winch-launching or auto-tow launching is requested.

ACJ 22.152 (Interpretative Material)

For showing compliance with the winch-launching requirements at least 6 winch-launches should be made, covering the range of speeds up to $V_w$. During these launches a range of release points should be selected along the flight path to cover the normal operating range and the release in emergency.

JAR 22.153 Approach and landing

(a) With a crosswind component of not less than 0·2 $V_{S0}$ or 15 km/h, whichever is the greater, it must be possible to perform normal approaches and landings until the sailplane comes to a stop, without exceptional piloting skill and without encountering any uncontrollable ground-looping tendency.

(b) After touchdown there must be no undue tendency to ground loop, pitching oscillation or nose over.

(c) The use of air brakes during the approach must not cause excessive variation of control force or control displacement nor affect the controllability of the sailplane, when it is brought into use at any allowable speed down to 1·2 $V_{S1}$, where $V_{S1}$ is appropriate to the configuration with air brakes retracted or extended, whichever gives the greater value.

JAR 22.155 Elevator control force in manoeuvres

The elevator control forces during turns or when recovering from manoeuvres must be such that an increase in load factor causes an increase in control force. The minimum value of this force for a stabilized turn with a 45° bank at 1·4 $V_{S1}$ must be 0·5 daN, with the controls trimmed to maintain the sailplane in equilibrium at 1·4 $V_{S1}$ in steady straight flight with wing-flaps in the most critical position, air brakes and, where applicable, landing gear retracted.

[Ch. 4, 7.5.87]

TRIM

JAR 22.161 Trim

(a) General. Each sailplane must meet the trim requirements of this paragraph after being trimmed and without further pressure upon, or movement of, the primary controls or their corresponding trim controls by the pilot.
(b) Lateral and directional trim

(1) Lateral trim. The sailplane must be capable of being so trimmed that there is no tendency for the sailplane when in straight flight at 1.4 \( V_{S1} \) with wing-flaps in all en-route positions, air brakes, and where applicable, landing gear retracted, to turn or bank, when the aileron control is released and the rudder control held fixed in the neutral position.

(2) Directional trim. The sailplane must be capable of being so trimmed that there is no tendency for the sailplane, when in straight flight at 1.4 \( V_{S1} \) with wing-flaps in all en-route positions, air brakes, and where applicable, landing gear retracted, to yaw when the rudder control is released and the aileron control held fixed in the neutral position.

(c) Longitudinal trim

(1) If the sailplane has no in-flight adjustable trimming device, the trim speed must be between 1.2 \( V_{S1} \) and 2.0 \( V_{S1} \) for all c.g. positions.

(2) If the sailplane has an in-flight adjustable trimming device, the following requirements must be met without further pressure upon or movement of the primary control or the corresponding trim control:

(i) the sailplane must maintain trim with wing-flaps in the landing position, the air brakes retracted and landing gear extended within the speed range between 1.2 \( V_{S1} \) and 2.0 \( V_{S1} \);

(ii) in towed flight the sailplane must maintain trim within the speed range between 1.4 \( V_{S1} \) and \( V_T \);

(iii) in the most adverse out-of-trim condition, the control force must be less than 20 daN between 1.1 \( V_{S1} \) and 1.5 \( V_{S1} \).

(3) For powered sailplanes, retraction and extension of the power-plant or propeller must not produce excessive trim changes.

(4) The powered sailplane, with the engine operating, must maintain longitudinal trim during:

(i) a climb with maximum continuous power at a speed \( V_Y \) with landing gear retracted and wing-flaps in the take-off position;

(ii) level flight at all speeds between \( V_Y \) and 0.9 \( V_H \), with the landing gear retracted and wing-flaps in positions appropriate to each speed.

[Ch. 4, 7.5.87]

STABILITY

JAR 22.171 General

The sailplane must meet the conditions of JAR 22.173 through JAR 22.181 inclusive. In addition the sailplane must show suitable stability and control ‘feel’ in any condition normally encountered in service.

JAR 22.173 Static longitudinal stability

(a) Under the conditions and throughout the speed range specified in JAR 22.175:

(1) The slope of the curve, stick force versus speed, must be positive and have a value such that any significant speed change will cause a variation in stick force plainly perceptible to the pilot.

(2) The slope of the curve, stick displacement versus speed, must not be negative, except that a negative slope may be acceptable provided that it can be demonstrated that there is no difficulty in control.

(b) The air speed must return to within \( \pm 15\% \) or \( \pm 15 \) km/h of the original trimmed speed, whichever is the greater when the control force is slowly released at any trimmable speed up to \( V_{NE} \) and where applicable \( V_{NE} \) and down to the appropriate minimum speed for steady unstalled flight. In addition, for a powered sailplane with the engine running, this requirement must be met at all allowable power settings.
Compliance with this requirement can be assumed, if the slope of the curve, stick force versus speed, is at least 1 N per 10 km/h at all speeds up to $V_{NE}$.

(1) In flight demonstration, the sailplane should be trimmed in steady flight and the speed should be increased by approximately 20% by moving the control column. The force on the column should then be relaxed very slowly, so as to avoid speed oscillation, and the speed at which the sailplane settles should be noted. The test should be repeated with the speed being decreased by approximately 20%.

(2) Suitable minimum and maximum trimmed speeds are:
   (a) Wing-flaps neutral (see ACJ 22.335): 1.3 $V_{S1}$ and the maximum trim speed but not exceeding 0.84 $V_{NE}$.
   (b) Wing-flaps in the landing position: 1.3 $V_{SO}$ and the minimum trim speed, but not exceeding 0.84 $V_{FE}$.

(3) Where no in-flight trimming device is fitted, the test should be made at the trimmed speed. In such case, the speed at which the force on the column is relaxed need not exceed $V_{NE}$ or $V_{FE}$ as appropriate, and need not be less than the minimum speed for steady unstalled flight.

[Ch. 4, 7.5.87; Ch. 5, 28.10.95]

The stick force/speed curve must have a stable slope in the following conditions:

(a) **Cruising configuration:**
   (1) at all speeds between 1.1 $V_{S1}$ and $V_{NE}$;
   (2) wing-flaps in the position for cruising and for circling flight;
   (3) landing gear retracted;
   (4) sailplane trimmed at 1.4 $V_{S1}$ and 2 $V_{S1}$ (if fitted with a trimming device); and
   (5) air brakes retracted.

(b) **Approach:**
   (1) at all speeds between 1.1 $V_{S1}$ and $V_{FE}$;
   (2) wing-flaps in the landing position;
   (3) landing gear retracted;
   (4) sailplane trimmed at 1.5 $V_{S1}$ (if fitted with a trimming device); and
   (5) air brakes both retracted and extended;
   (6) engine idling (throttle closed); and
   (7) propeller in take-off position.

**Ch. 4, 7.5.87; Ch. 5, 28.10.95**
Subpart B

JAR 22.175 (continued)

(2) Wing-flap positions should include negative positions, where provided. (See ACJ 22.335)

[Ch. 4, 7.5.87; Ch. 5, 28.10.95]

JAR 22.177 Lateral and directional stability

(a) With the sailplane in straight steady flight, and when the aileron and rudder controls are gradually applied in opposite direction, any increase in sideslip angle must correspond to an increased deflection of the lateral control. This behaviour need not follow a linear law.

(b) In a sideslip any control force reversal must not be such as to require exceptional piloting skill to control the sailplane.

JAR 22.181 Dynamic stability

Any short period oscillations occurring between the stalling speed and $V_{DF}$, must be heavily damped with the primary controls:

(a) Free.

(b) Fixed.

In the case of a powered sailplane this requirement must be met with the engine running at all allowable powers.

[Ch. 1, 18.5.81]

STALLS

JAR 22.201 Wings level stall

(a) Stall demonstrations must be conducted by reducing the speed by approximately 2 km/h per second until either a stall results as evidenced by a downward pitching motion or rolling motion not immediately controllable or until the longitudinal control reaches the stop. It must be possible to produce and correct roll and yaw by unreversed use of the controls until the stall occurs.

(b) It must be possible to prevent more than 30° of roll by normal use of the controls during recovery. There must be no uncontrollable tendency of the sailplane to spin.

(c) Stalling behaviour must not be unduly sensitive to sideslip.

JAR 22.201(c) (continued)

AMC 22.201(c)

Yawing angles up to 5° should not appreciably change the stalling characteristics.

(d) The loss of altitude from the beginning of the stall until regaining level flight by applying normal procedures and the maximum pitch attitude below the horizon must be determined.

IEM 22.201(d)

The loss of altitude during the stall is the difference between the altitude at which the stall occurs and that altitude at which level flight is regained.

(e) With the sailplane in straight flight at 1.2 $V_{S1}$ in the configuration appropriate to winch-launching by pulling rapidly on the control stick, a pitch attitude approximately 30° above the horizon must be achieved and the resulting stall must not be severe and such as to make prompt recovery difficult.

(f) Compliance with the requirements of sub-paragraphs (a) through (d) and (g) of this paragraph must be shown under the following conditions:

(1) wing-flaps in any position;

(2) air brakes retracted and extended;

(3) landing gear retracted and extended;

(4) sailplane trimmed to 1.5 $V_{S1}$ (if fitted with a trimmer);

(5) additionally, for powered sailplanes:

(i) cowl flaps in appropriate configuration;

(ii) power:

- engine idling, and

- 90% of maximum continuous power;

(iii) propeller in take-off position

(g) Unless it can be shown that asymmetric water ballast is unlikely to occur, the stall demonstration of sub-paragraph (a) of this paragraph must be made for the most critical loadings, and it must be shown that it is possible to regain level flight without encountering uncontrollable rolling or spinning tendencies.

[Ch. 1, 18.5.81; Ch. 4, 7.5.87]
JAR 22.203 Turning flight stalls

(a) When stalled during a co-ordinated 45° banked turn, it must be possible to regain normal level flight without encountering uncontrollable rolling or spinning tendencies. Compliance with this requirement must be shown under the conditions of JAR 22.201(f) that result in the most critical stall behaviour of the sailplane. In any case the landing configuration, with airbrakes retracted and extended, must be investigated.

(b) The loss of altitude from beginning of the stall until regaining level flight by applying normal procedures must be determined.

[J. 1, 18.5.81; Ch. 4, 7.5.87]

JAR 22.207 Stall warning

(a) Except as provided by 22.207(d), there must be a clear and distinctive stall warning with air brakes, wing-flaps and landing gear in any normal position, both in straight and in turning flight. In the case of a powered sailplane compliance with this requirement must also be shown with the engine running in the conditions prescribed in JAR 22.201(f)(5).

(b) The stall warning may be furnished either through the inherent aerodynamic qualities of the sailplane (e.g. buffeting) or by a device that will give clearly distinguishable indications.

IEM 22.207(b)

A visual stall warning alone is not acceptable.

(c) The stall warning must begin at a speed between 1.05 \( V_{S1} \) and 1.1 \( V_{S1} \) and must continue until the stall occurs.

(d) Compliance with 22.207(a) through (c) is not required for a sailplane, a self-launching powered sailplane with the engine stopped, or a self-sustaining powered sailplane with the engine stopped or running if the following are met with air brakes, wing-flaps and landing gear in any normal position:

(1) recovery from a stall is prompt in both straight and turning flight;

(2) when a stall occurs from straight flight:

(i) it is possible to produce and correct roll by using the ailerons, the rudder being held natural; and

(ii) no appreciable wing-dropping occurs when both ailerons and rudder are held natural;

(3) when a stall occurs in a co-ordinated 45° banked turn, any subsequent rolling or yawing motion is not rapid and is readily controllable.

[Ch. 1, 18.5.81; Amdt. 6, 01.08.01]

SPINNING

JAR 22.221 General

(a) Compliance with the following requirements must be shown in all configurations and, for a powered sailplane, with the engine idling.

Unless it can be shown that asymmetric water-ballast is unlikely to occur by malfunction or with lateral accelerations during a spin, the demonstrations of sub-paragraphs (b) through (g) must also be made for the most critical water-ballast loadings.

(b) The sailplane must be able to recover from spins of at least five turns or such lesser number at which the spin changes into a spiral dive, by applying the controls in a manner normal for recovery and without exceeding either the limiting air-speed nor the limiting positive manoeuvring load factor for the sailplane. Tests must be conducted with wing-flaps and air-brakes neutral (see ACJ 22.335) and with:

(1) controls held in the position normal for spins;

(2) ailerons and rudder used in opposite directions;

(3) ailerons applied in the direction of rotation.

In addition and where applicable, tests must be conducted in critical combinations of air-brake extension, wing-flap deflection, water-ballast including trim water-ballast and with the powerplant extended or retracted.

For wing-flap positions for which a \( V_{FE} \) limitation is established, the flap position may be adjusted during recovery after the autorotation has stopped.
It will normally be sufficient to conduct a number of spins of about two turns in each of the conditions of JAR 22.221(b) and subsequently to conduct spins of five turns in the most adverse cases.

(c) A sailplane, in the configurations certificated for intentional spinning, must be able to recover from any point in a spin as defined in JAR 22.221(b) in not more than one additional turn. In those configurations not approved for intentional spinning, subparagraph (d) shall be applied.

(d) A sailplane in the configurations not certificated for intentional spinning, must still be able to recover from a spin as defined in JAR 22.221(b) in not more than one and a half additional turns.

(e) In addition, any sailplane must be able to recover from a one turn spin in any configuration in not more than one additional turn.

(f) The loss of altitude from the point at which recovery is initiated to the point at which horizontal flight is first regained must be determined in all of the above mentioned cases.

The standard procedure to recover from a spin is as follows:

Where applicable, close throttle.
Sequentially:
(1) Check ailerons neutral.
(2) Apply rudder opposite to the direction of the spin.
(3) Ease the control column forward until rotation ceases.
(4) Centralise rudder and ease out of the ensuing dive.

(g) It must be impossible to obtain uncontrollable spins with any use of the controls.

It must be impossible to obtain uncontrollable spins with any use of the controls.

[Ch. 4, 7.5.87; Ch. 5, 28.10.95]

JAR 22.233 Directional stability and control

(a) With cross-wind components not less than 0.2 $V_{SO}$ or 15 km/h, whichever is the greater, there must be no uncontrollable ground-loop tendency at any speed at which the powered sailplane may be expected to be operated on the ground.

(b) The powered sailplane must have adequate directional control during taxiing.

[Ch. 1, 18.5.81]

JAR 22.251 Vibration and buffeting

Each part of the sailplane must be free from excessive vibration at all speeds up to at least $V_{DF}$. In addition, there must be no buffeting, in any normal flight condition including the use of air brakes, severe enough to interfere with the satisfactory control of the sailplane, cause excessive fatigue to the crew, or result in structural damage. Stall warning buffeting within these limits is allowable. In the case of a powered sailplane this requirement must be met with the engine running at all allowable powers.

[Ch. 1, 18.5.81]

JAR 22.255 Aerobatic manoeuvres

(a) Each Aerobatic and Utility Category sailplane must be able to perform safely the aerobatic manoeuvres for which certification is requested.

(b) It must be shown that aerobatic manoeuvres can be carried out with adequate margins between the speeds and accelerations...
attained therein and the proof strength and design speed of the sailplane.

(c) When determining the flight characteristics, account must be taken of the possibility of exceeding the recommended entry speeds for the manoeuvres and errors which are likely to be made by the pilot while being trained for aerobatic manoeuvres.

(d) During the flight tests it is not permitted to use any means (e.g. air brakes, wing-flaps) to restrict the speed in aerobatic manoeuvres.

(e) The recommended entry speed and where appropriate, the maximum acceleration must be determined for each manoeuvre approved.

[Ch. 1, 18.5.81]
GENERAL

JAR 22.301 Loads
(a) Strength requirements are specified in terms of limit loads (the maximum loads to be expected in service) and ultimate loads (limit loads multiplied by prescribed factors of safety). Unless otherwise provided, prescribed loads are limit loads.
(b) Unless otherwise provided, the air and ground loads must be placed in equilibrium with inertia forces, considering each item of mass in the sailplane. These loads must be distributed so as to represent actual conditions or a conservative approximation to them.
(c) If deflections under load would significantly change the distribution of external or internal loads, this redistribution must be taken into account.

JAR 22.303 Factor of safety
Unless otherwise provided, a factor of safety of 1.5 must be used.

JAR 22.305 Strength and deformation
(a) The structure must be able to support limit loads without permanent deformation. At any load up to limit loads, the deformation may not interfere with safe operation. This applies in particular to the control system.
(b) The structure must be able to support ultimate loads without failure for at least three seconds. However, when proof of strength is shown by dynamic tests simulating actual load conditions, the three second limit does not apply.

JAR 22.307 PROOF OF STRUCTURE
(a) Compliance with the strength and deformation requirements of JAR 22.305 must be shown for each critical load condition. Structural analysis may be used only if the structure conforms to those for which experience has shown this method to be reliable. In other cases, substantiating load tests must be made.

IEM 22.307
(1) Substantiating load tests made in accordance with JAR 22.307(a) should normally be taken to ultimate design load.
(2) The results obtained from strength tests should be so corrected for departures from the mechanical properties and dimensions assumed in the design calculations as to establish that the possibility of any structure having a strength less than the design value, owing to material and dimensional variation, is extremely remote.
(b) Certain parts of the structure must be tested as specified in Subpart D of this Part.
NOTE: Structural requirements contained in Subpart C do not constitute all the structural requirements necessary to show compliance with JAR–22.

FLIGHT LOADS

JAR 22.321 General
(a) Flight load factors represent the ratio of the aerodynamic force component (acting normal to the flight path of the sailplane) to the weight of the sailplane. A positive flight load factor is one in which the aerodynamic force acts upward, with respect to the sailplane.
(b) Compliance with the flight load requirements of this Subpart must be shown:
   (1) at each critical altitude within the range in which the sailplane may be expected to operate; and
   (2) at each practicable combination of weight and disposable load.

IEM 22.321(b)
For sailplanes altitude is not normally critical for flight loads; for powered sailplanes propeller torque and thrust are normally greatest at sea-level.

JAR 22.331 Symmetrical flight conditions
(a) The appropriate balancing horizontal tail load must be accounted for in a rational or conservative manner when determining the wing loads and linear inertia loads corresponding to any of the symmetrical flight conditions specified in JAR 22.333 through 22.345.
(b) The incremental horizontal tail loads due to manoeuvring and gusts must be reacted by the angular inertia of the sailplane in a rational or conservative manner.

(c) In computing the loads arising in the prescribed conditions, the angle of attack is assumed to be changed suddenly without loss of flight speed until the prescribed load factor is attained. Angular accelerations may be disregarded.

(d) Aerodynamic data required for the establishment of the loading conditions must be verified by tests, calculations or by conservative estimation.

(1) In the absence of better information the maximum negative lift coefficient in the normal configuration may be taken as \(-0.8\).

(2) If the pitching moment coefficient $C_{\text{mo}}$ is less than $\pm 0.025$, a coefficient of at least $-0.025$ must be used for the wing and horizontal tail.

JAR 22.333 Flight envelope

(a) **General.** Compliance with the strength requirements of this Subpart must be shown at any combination of air speed and load factor on and within the boundaries of the flight envelopes specified by the manoeuvring and gust criteria of sub-paragraphs (b) and (c) of this paragraph respectively.

(b) **Manoeuvring envelope.** Wing-flaps in the en-route setting, air brakes closed. (See Figure 1.)
(c) Gust envelope. Wing-flaps in the en-route setting. (See Figure 2.)

1. At the design speed $V_D$, the sailplane must be capable of withstanding positive (up) and negative (down) gusts of 15 m/s acting normal to the flight path.

2. At the design maximum speed $V_D$, the sailplane must be capable of withstanding positive (up) and negative (down) gusts of 7.5 m/s acting normal to the flight path.

---

JAR 22.335  Design air speeds

The selected design air speeds are equivalent air speeds (EAS):

(a) Design manoeuvring speed $V_A$

$$V_A = V_{SI} \sqrt{n_1}$$

where:

$V_{SI} =$ estimated stalling speed at design maximum weight with wing flaps neutral and air brakes retracted

---

**FIGURE 2  GUST ENVELOPE**
(b) Design flap speed, $V_F$

(1) For each landing setting, $V_F$ must not be less than the greater of:

(i) $1.4 \times V_{S1}$, where $V_{S1}$ is the computed stalling speed with wing-flaps neutral at the maximum weight.

(ii) $2.0 \times V_{SF}$, where $V_{SF}$ is the computed stalling speed with wing-flaps fully extended at the maximum weight.

(2) For each positive en-route setting, $V_F$ must not be less than the greater of:

(i) $2.7 \times V_{S1}$, where $V_{S1}$ is the computed stalling speed at design maximum weight with wing flaps in the particular positive en-route setting.

(ii) $1.05 \times V_A$, where $V_A$ is determined in accordance with sub-paragraph (a) of this paragraph, i.e. for wing-flaps neutral.

(3) For all other settings, $V_F$ must equal $V_D$.

(c) Design Gust Speed $V_B$. $V_B$ must not be less than $V_A$.

(d) Design Aerotow Speed $V_T$. $V_T$ must not be less than 125 km/h.

(e) Design Winch-launching Speed $V_W$. $V_W$ must not be less than 110 km/h.

(f) Design Maximum Speed $V_D$. The design maximum speed may be chosen by the applicant but must not be lower than:

$$V_D = 18 \sqrt{W \over S} \left(1 \over C_{d\min}\right) \text{(km/h) for sailplanes of Category U}$$

$$V_D = 3.5 \left( W \over S \right) + 200 \text{(km/h) for sailplanes of Category A}$$

where:

$W = \text{Wing loading (daN/m}^2\text{) at design maximum weight}$

$S = \text{Design wing area (m}^2\text{)}$

$C_{d\min} = \text{The lowest possible drag coefficient of the sailplane}$

For a powered sailplane, $V_D$ must also not be lower than $1.35 \times V_H$.

---

IEE 22.335 (continued)

(1) For flaps, the controls for which are intended to be operated in both high and low speed flight, the term ‘wing-flaps neutral’ in JAR 22.335(a) and JAR 22.335(b) is defined (unless a recognised aerofoil profile is adopted which thus defines the neutral position) as that wing-flap setting which results when one third of the total range of en-route wing-flap settings is subtracted from the most negative setting.

(2) For flaps, the controls for which are intended to be operated during low speed flight only, i.e. slotted flaps, split flaps and other flaps where extension is conventional and only in the positive direction, ‘wing-flaps neutral’ is the retracted or most-upwardly-deflected setting.

[Ch. 1, 18.5.81; Ch. 4, 7.5.87; Ch. 5, 28.10.95]

JAR 22.337 Limit manoeuvring load factors

The limit manoeuvring load factors on the V-n diagram (see Figure 1) must have at least the following values:

<table>
<thead>
<tr>
<th>Category</th>
<th>U</th>
<th>A</th>
</tr>
</thead>
<tbody>
<tr>
<td>$n_1$</td>
<td>+5.3</td>
<td>+7.0</td>
</tr>
<tr>
<td>$n_2$</td>
<td>+4.0</td>
<td>+7.0</td>
</tr>
<tr>
<td>$n_3$</td>
<td>–1.5</td>
<td>–5.0</td>
</tr>
<tr>
<td>$n_4$</td>
<td>–2.65</td>
<td>–5.0</td>
</tr>
</tbody>
</table>

JAR 22.341 Gust load factors

(a) In the absence of a more rational analysis, the gust load factors must be computed as follows:

$$n = 1 \pm \left[\left( k \over 2 \right) \rho_o U V a \over mg \over S \right]$$

where:

$\rho_o = \text{density of air at sea-level (kg/m}^3\text{)}$

$U = \text{gust velocity (m/s)}$

$V = \text{equivalent air speed (m/s)}$

$a = \text{slope of wing lift curve per radian}$

$m = \text{mass of the sailplane (kg)}$

$G = \text{acceleration due to gravity (m/s}^2\text{)}$

$S = \text{design wing area (m}^2\text{)}$

$k = \text{gust alleviation factor calculated from the following formula:}$

$$k = \frac{0.88\mu}{5.3 + \mu}$$
where:

\[
\mu = \frac{2 \left( \frac{m}{S} \right)}{\rho \, \text{lm} \, a}
\]

(non-dimensional sailplane mass ratio)

where:

- \(\rho\) = density of air (\(\text{kg/m}^3\)) at the altitude considered
- \(\text{lm}\) = mean geometric chord of wing (m)

(b) The value of \(n\) calculated from the expression given above need not exceed:

\[
n = 1.25 \left( \frac{V}{V_{SL}} \right)^2
\]

JAR 22.345 Loads with air brakes and wing-flaps extended

(a) Loads with air brakes extended

1. The sailplane structure including airbrake system, must be capable of withstanding the most unfavourable combination of the following parameters:

<table>
<thead>
<tr>
<th>Equivalent Air speed</th>
<th>(V_D) (EAS)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Air brakes</td>
<td>from the retracted to the fully extended position</td>
</tr>
<tr>
<td>Manoeuvring load factor</td>
<td>from 0 to 3.5</td>
</tr>
</tbody>
</table>

2. The horizontal tail load is assumed to correspond to the static condition of equilibrium.

3. In determining the spanwise load distribution, changes in this distribution due to the presence of the air brakes must be accounted for.

(b) Load with wing-flaps extended. If wing-flaps are installed, the sailplane must be assumed to be subjected to manoeuvres and gusts as follows:

1. With wing-flaps in all landing settings, at speeds up to \(V_F\):
   - (i) manoeuvring up to a positive limit load factor of 4.0;
   - (ii) positive and negative gusts of 7.5 m/s acting normal to the flight path.

2. With wing-flap positions from the most positive en-route setting to the most negative setting, the manoeuvring conditions of JAR 22.333(b) and the gust conditions of JAR 22.333(c), except that the following need not be considered:
   - (i) speeds greater than the \(V_F\) appropriate to the wing-flap setting;
   - (ii) manoeuvring load factors corresponding to points above the line AD or below the line GE of Figure 1.

(c) Speed limiting flaps. If wing-flaps are to be used as a drag-increasing device for the purpose of speed limitation (air-brake) conditions specified in JAR 22.345(a) must be met for all wing-flap positions.

(d) When an automatic wing-flap load limiting device is used, the sailplane must be designed for the critical combination of air speed and wing-flap position allowed by that device.

[Ch. 4, 7.5.97]

JAR 22.347 Unsymmetrical flight conditions

The sailplane is assumed to be subjected to the unsymmetrical flight conditions of JAR 22.349 and JAR 22.351. Unbalanced aerodynamic moments about the c.g. must be reacted in a rational or conservative manner, considering the principal masses furnishing the reacting inertia forces.

IEM 22.347

The sailplane is assumed to maintain its attitude after the control surfaces have been activated to initiate roll or yaw until the resulting incremental loads have reached their highest value.

JAR 22.349 Rolling conditions

The sailplane must be designed for the rolling loads resulting from the aileron deflections and speeds specified in JAR 22.455 in combination with a load factor of at least two-thirds of the positive manoeuvring load factors prescribed in JAR 22.337.

JAR 22.351 Yawing conditions

The sailplane must be designed for yawing loads on the vertical tail surface specified in JAR 22.441 and JAR 22.443.
JAR 22.361 Engine torque

(a) The engine mount and its supporting structure must be designed for the effects of:

(1) the limit torque corresponding to take-off power and propeller speed, acting simultaneously with 75% of the limit loads from flight condition A of JAR 22.333(b);

(2) the limit torque corresponding to the maximum continuous power and propeller speed, acting simultaneously with the limit loads from flight condition A of JAR 22.333(b).

(b) For reciprocating engines the limit torque to be accounted for in JAR 22.361(a) is obtained by multiplying the mean torque by one of the following factors:

(1) 1.33 for engines with 5 or more cylinders;
(2) 2 for engines with 4 cylinders;
(3) 3 for engines with 3 cylinders;
(4) 4 for engines with 2 cylinders.

JAR 22.363 Side load on engine mount

(a) The engine mount and its supporting structure must be designed for a limit load factor in a lateral direction, for the side load on the engine mount, of not less than one-third of the limit load factor for flight condition A (1/3 n1).

(b) The side load prescribed in (a) may be assumed to be independent of other flight conditions.

JAR 22.371 Gyroscopic Loads

For powered sailplanes of airworthiness Category A, the engine mount and its supporting structure must be designed for gyroscopic loads resulting from maximum continuous r.p.m.

JAR 22.375 Winglets

(a) When winglets are installed the sailplane must be designed for:

(1) The side loads due to maximum sideslip angle of the winglet at V_A;
(2) Loads resulting from gusts acting perpendicularly to the surface of the winglet at V_B and V_D;
(3) Mutual interaction effects of winglets and wing on aerodynamic loads;
(4) Hand forces on the winglets; and
(5) Loads due to wingtip landing as specified in JAR 22.501, if the winglet can touch the ground.

IEM 22.375(a)

For the wing the interactive effects between the winglets and the wing should be taken into account, as there are:

(1) Changes in wing lift distribution:
(2) Additional bending and torsion moments at the attachment point of the winglet due to aerodynamic and mass loads on the winglet;
(3) Effects of inertia; and
(4) Effects of drag on wing torsion.

(b) In the absence of more rational analysis the loads must be computed as follows:

(1) The lift at the winglets due to sideslip at V_A:

\[ L_{\text{w\_sideslip}} = 1.25 C_{L_{\text{max}}} S_w \frac{\rho \omega^2}{2} V_A^2 \]

where:
- \( C_{L_{\text{max}}} \) = maximum lift coefficient of winglet profile
- \( S_w \) = area of winglet

(2) The lift at the winglets due to lateral gust at V_B and V_D:

\[ L_{\text{w\_gust}} = a_w S_w \frac{\rho U^2}{2} V U k \]

where:
- \( U \) = lateral gust velocity at the values as described in JAR 22.33(c)
- \( a_w \) = slope of winglet lift curve per radian
- \( k \) = Gust alleviation factor as defined in JAR 22.443(b)

The above-described load \( L_{\text{w\_gust}} \) need not exceed the value

\[ L_{\text{W\_max}} = 1.25 C_{L_{\text{max}}} S_w \frac{\rho \omega^2}{2} V_{\text{max}}^2 \]

(3) Hand forces of 15 daN must be assumed to act at the tip of the winglet:

(i) In horizontal inboard and outboard direction parallel to the spanwise axis of the wing; and
(ii) In horizontal forward and backward direction parallel to the longitudinal axis of the fuselage.

In addition, the rigging loads as specified in JAR 22.591 must be applied if the winglet plane is not normal to the plane of the wing.

[Ch. 5, 28.10.95]

CONTROL SURFACES AND SYSTEMS

JAR 22.395 Control system loads

(a) Each flight control system, including stops, and its supporting structure must be designed for the loads corresponding to at least 125% of the computed hinge moments of the movable control surfaces in the conditions prescribed in JAR 22.415 through JAR 22.455. In computing the hinge moments reliable aerodynamic data must be used. The effects of tabs must be taken into account. In no case must the loads in any part of the system be less than those resulting from the application of 60% of the pilot efforts specified in JAR 22.397(a).

(b) Pilot forces used for design are assumed to act at the appropriate control grips or pads as they would in flight, and to be reacted at the attachments of the control system to the control surface horns.

[Ch. 4, 7.5.97]

JAR 22.397 Loads resulting from limit pilot forces

(a) In addition to JAR 22.395(a) the control systems for the direct control of the sailplane about its longitudinal, lateral, or yaw-axis (main control system) and other control systems affecting flight behaviour and supporting points must be designed to withstand as far as to the stops (these included) limit loads arising from the following pilot forces:

<table>
<thead>
<tr>
<th>Control</th>
<th>Pilot force daN</th>
<th>Method of force application assuming single lever control systems</th>
</tr>
</thead>
<tbody>
<tr>
<td>Elevator</td>
<td>35</td>
<td>Push and pull handgrip of control stick</td>
</tr>
<tr>
<td>Ailerons</td>
<td>20</td>
<td>Move handgrip of control stick sideways</td>
</tr>
<tr>
<td>Control</td>
<td>Pilot force daN</td>
<td>Method of force application assuming single lever control systems</td>
</tr>
</tbody>
</table>

(b) The rudder control system must be designed to a load of 100 daN per pedal acting simultaneously on both pedals in forward direction.

[Ch. 4, 7.5.97]

JAR 22.399 Dual control systems

Dual control systems must be designed for:

(a) the pilots acting together in the same direction; and

(b) the pilots acting in opposition, each pilot applying 0.75 times the load specified in JAR 22.397(a).

JAR 22.405 Secondary control systems

Secondary control systems such as those for landing gear retraction or extension, trim control, etc., must be designed for supporting the maximum forces that a pilot is likely to apply to those controls.

IEM 22.405

Hand and foot loads assumed for design should not be less than the following:

(1) Hand loads on small hand-wheels, cranks, etc., applied by finger or wrist-force: $P = 15$ daN.

(2) Hand loads on levers and hand-wheels applied by the force of an unsupported arm without making use of the body weight: $P = 35$ daN.

(3) Hand loads on levers and hand-grips applied by the force of a supported arm or by making use of the body weight: $P = 60$ daN.

(4) Foot loads applied by the pilot when sitting with his back supported (e.g. toe-brake operating loads): $P = 75$ daN.

JAR 22.411 Control system stiffness and stretch

(a) The amount of movement available to the pilot of any aerodynamic control surface may
not, in any condition of flight, be excessively reduced by elastic stretch of the control circuits.

If there are cables in the system and tension can be adjusted, the minimum value must be used for demonstrating compliance with all appropriate requirements.

**AMC 22.411(a)**

Control systems will normally be accepted as complying with paragraph 22.411(a) if they meet the following:

Under the application of the loads prescribed in JAR 22.395, no part of the control system should stretch or shorten by more than 25%. The stretch percentage is defined as \( D_e = 100 \frac{a}{A} \) where:

\[ a = \text{comparable movement of the cockpit controls when the pilot effort is resisted by fixing the control surfaces at their zero settings} \]

\[ A = \text{available positive or negative movement of the cockpit controls (measured from their neutral position) when the control surface and the control mechanism are free.} \]

However, stretch or shortening greater than 25% may be acceptable provided special attention is given to compliance with JAR 22.143 and JAR 22.629 in these conditions.

(b) For cable operated systems, the allowable rigging tension in the cables must be established, taking into consideration the variations in temperature (see JAR 22.689) which may occur.

**JAR 22.415 Ground gust conditions**

The control system from the control surfaces to the stops, or when installed, the arresting devices must be designed for limit loads corresponding to hinge moments calculated from the expression:

\[ M_R = k l_R S_R q \]

where:

\( M_R = \text{limit hinge moment} \]

\( l_R = \text{mean chord of control surface aft of hinge line} \]

\( S_R = \text{area of control surface aft of hinge line} \]

\( q = \text{dynamic pressure corresponding to an air speed of 100 km/h} \]

\( k = \text{limit hinge moment factor due to ground gust, taken from the following table:} \]

<table>
<thead>
<tr>

</tbody>
</table>

**HORIZONTAL TAIL SURFACES**

**JAR 22.421 Balancing loads**

(a) A horizontal tail balancing load is the load necessary to maintain equilibrium in any specified flight condition with no pitching acceleration.

(b) The horizontal tail must be designed for the balancing loads occurring at any point of the limit manoeuvring envelope and in the air-brake and wing-flap positions as specified in JAR 22.333 and JAR 22.345.

**JAR 22.423 Manoeuvring loads**

The horizontal tail must be designed for the most severe loads likely to occur in pilot-induced pitching manoeuvres, at all speeds up to \( V_D \).
AMC 22.423 (Acceptable Means of Compliance)

Method I – The loads should be calculated for instantaneous deflection of the elevator, the following cases being considered:

(a) speed $V_A$, maximum upward deflection;

(b) speed $V_A$, maximum downward deflection;

(c) speed $V_D$, one-third maximum upward deflection;

(d) speed $V_D$, one-third maximum downward deflection.

The following assumptions should be made:

(1) The sailplane is initially in level flight, and its attitude and air speed do not change.

(2) The loads are balanced by inertia forces.

The sailplanes of Category A, initial conditions of both erect and inverted flight should be considered.

Method II – The loads should be calculated for instantaneous deflection of the elevator such as to cause the normal acceleration to change from an initial value to a final value, the following cases being considered (see Figure 3).

<table>
<thead>
<tr>
<th>Category U and A:</th>
<th>Speed</th>
<th>Initial Condition</th>
<th>Final Condition</th>
<th>Load Factor Increment</th>

<td>$1 - n_i$</td>
<td></td>
</tr>
</tbody>
</table>

For the purpose of this ACJ 22.423 the difference in air speed between $V_A$ and the value corresponding to point $G$ on the manoeuvring envelope should be ignored.

The following assumptions should be made:

(1) The sailplane is initially in level flight, and its attitude and air speed do not change;

(2) The loads are balanced by inertia forces;

(3) The aerodynamic tail load increment is given by

$$\Delta P = \Delta n \frac{m g}{h} - \frac{S_t}{a} \frac{a_h}{a} \left(1 - \frac{d \varepsilon}{d \alpha}\right) \frac{\rho_o}{2} \left(\frac{S_t a_h l_t}{m}\right)$$

where:

- $\Delta P$ = horizontal tail load increment, positive upwards (N)
- $\Delta n$ = load factor increment
- $m$ = mass of the sailplane (kg)
- $g$ = acceleration due to gravity (m/s$^2$)
- $x_{cg}$ = longitudinal distance of sailplane c.g. aft of aerodynamic centre of sailplane less horizontal tail (m)
- $S_t$ = horizontal tail area (m$^2$)
- $a_h$ = slope of horizontal tail lift curve per radian
- $d \varepsilon = d \alpha$ = rate of change of downwash angle with angle of attack
- $\rho_o$ = density of air at sea-level (kg/m$^3$)
- $l_t$ = tail arm (m)
- $S$ = wing area (m$^2$)
- $a$ = slope of wing lift curve per radian
In the absence of a more rational analysis, the horizontal tail loads must be computed as follows:

\[ P = P_o + \frac{\rho_o}{2} S_t \ a_h \ U \ kH \ V \left( 1 - \frac{d\varepsilon}{d\alpha} \right) \]

where:

- \( P \) = horizontal tail load (N)
- \( P_o \) = horizontal tail balancing load acting on the horizontal tail before the appearance of the gust (N)
- \( \rho_o \) = density of air at sea-level (kg/m\(^3\))
- \( S_t \) = area of horizontal tail (m\(^2\))
- \( a_h \) = slope of horizontal tail lift curve per radian
- \( U \) = gust speed (m/s)
- \( kH \) = gust factor. In the absence of a rational analysis the same value may be taken as for the wing.
- \( V \) = speed of flight (m/s)
- \( d\varepsilon \) = rate of change of downwash angle with \( d\alpha \) = wing angle of attack
JAR 22.427 Unsymmetrical loads for powered sailplane

The slipstream effect on fixed surfaces and on rudder loads must be accounted for if such loading is to be expected.

[Ch. 4, 7.5.97]

**VERTICAL TAIL SURFACES**

JAR 22.441 Manoeuvring load

The vertical tail surfaces must be designed for manoeuvring loads imposed by the following conditions:

(a) At speed the greater of $V_A$ and $V_T$, full deflection of the rudder.

(b) At speed $V_D$, one-third of full deflection of the rudder.

IEM 22.441

For sailplanes where the horizontal tail is supported by the vertical tail, the tail surfaces and their supporting structure including the rear portion of the fuselage should be designed to withstand the prescribed loadings on the vertical tail and the rolling moment induced by the horizontal tail acting in the same direction.

For T-tails in the absence of a more rational analysis, the rolling moment induced by side-slip or deflection of the vertical rudder may be computed as follows:

$$M_r = 0.2 \, S_f \, \frac{p_0}{2} \, \beta \, V^2 \, b_h \, k$$

where:

- $M_r =$ induced rolling moment at horizontal tail (Nm)
- $b_h =$ span of horizontal tail (m)
- $\beta =$ side-slip angle (radian)

[Ch. 4, 7.5.97]

IEM 22.443

For sailplanes where the horizontal tail is supported by the vertical tail, the tail surfaces and their supporting structure including the rear portion of the fuselage should be designed to withstand the prescribed loadings on the vertical tail and the rolling moment induced by the horizontal tail acting in the same direction.

For T-tails in the absence of a more rational analysis, the rolling moment induced by gust load may be computed as follows:

$$M_r = 0.2 \, S_f \, \frac{p_0}{2} \, V \, U \, b_h \, k$$

where:

- $M_r =$ induced rolling moment horizontal tail (Nm)
- $b_h =$ span of horizontal tail (m)

[Ch. 4, 7.5.97]

**SUPPLEMENTARY CONDITIONS FOR TAIL SURFACES**

JAR 22.447 Combined loads on tail surfaces

(a) The unsymmetrical distribution of the balancing load on the horizontal tail which arises in flight conditions A and D of the V-n envelope shall be combined with the appropriate manoeuvring load on the vertical surface as specified in JAR 22.441 acting in such a direction as to increase the rolling torque.

(b) 75% for Category U and 100% for Category A of the loads according to JAR 22.423 for the horizontal tail and JAR 22.441 for the vertical tail must be assumed to be acting simultaneously.
IEM 22.447 (a)

(1) In the absence of rational data the unsymmetrical distribution shall be obtained by multiplying the air load on one side of the plane of symmetry by \((1+x)\) and on the other side by \((1-x)\).

(2) For point A of the V-n envelope the value of \(x\) shall be 0.34 and in the case of an aerobatic category sailplane certificated for flick manoeuvres \(x\) shall be 0.5. For point D the value of \(x\) shall be 0.15.

(3) The unsymmetrical horizontal tail load must not be combined with the induced rolling moment at the T-tail.

[Ch. 4, 7.5.97; Ch. 5, 28.10.95]

JAR 22.449 Additional loads applicable to V-tails

A sailplane with V-tail, must be designed for a gust acting perpendicularly with respect to one of the tail surfaces at speed \(V_B\).

AILERONS

JAR 22.455 Ailerons

The ailerons must be designed for control loads corresponding to the following conditions:

(a) at speed the greater of \(V_A\) and \(V_T\) the full deflection of the aileron; and

(b) at speed \(V_D\), one-third of the full deflection of the aileron.

GROUND LOADS

JAR 22.471 General

The limit ground loads specified in this Subpart are considered to be external loads and inertia forces that act upon a sailplane structure. In each specified ground load condition, the external reactions must be placed in equilibrium with the linear and angular inertia forces in a rational or conservative manner.

JAR 22.473 Ground load conditions and assumptions

(a) The ground load requirements of this Subpart, must be complied with at the design maximum weight.

(b) The selected limit vertical inertia load factor at the c.g. of the sailplane for the ground load conditions prescribed in this Subpart may not be less than that which would be obtained when landing with a descent velocity of 1.5 m/s.

(c) Wing lift balancing the weight of the sailplane may be assumed to exist throughout the landing impact and to act through the c.g. The ground reaction load factor may be equal to the inertia load factor minus one.

JAR 22.477 Landing gear arrangement

JAR 22.479 through JAR 22.499 apply to sailplanes with conventional arrangements of landing gear. For unconventional types it may be necessary to investigate additional landing conditions depending on the arrangement and design of the landing gear units.

IEM 22.477

For the purpose of these requirements landing gears are considered conventional if they consist of:

(1) A single wheel or twin coaxial wheels at the bottom of the fuselage or two laterally separated single wheels (with or without shock absorbers) located directly, or nearly so, below the c.g. of the sailplane, together with a nose wheel or with auxiliary skids attached to the bottom of the fuselage, one auxiliary skid running from the main wheel (or wheels) forward to the nose and the other running aft to a point approximately below the wing trailing edge. The rear skid may be replaced or supplemented by a suitable tail skid. Both skids may be replaced by suitable reinforcements of the fuselage structure.

(2) A single elastic main skid at the bottom of the fuselage extending from the nose to a point approximately below the wing trailing edge. This skid may be supplemented by a tail skid or wheel.

(3) Wing-tip skids.

[Ch. 4, 7.5.97]
JAR 22.479  Level landing condition

(a) For a level landing, the sailplane is assumed to be in the following attitudes:

(1) For sailplanes with a tail skid and/or wheel, a normal level flight attitude.

(2) For sailplanes with nose wheels, attitudes in which –
   (i) The nose and main wheels contact the ground simultaneously; and
   (ii) The main wheels contact the ground and the nose wheel is just clear of the ground.

(b) The main gear vertical load component $P_{VM}$ must be determined to the conditions in JAR 22.725.

(c) The main gear vertical load component $P_{VM}$ must be combined with a rearward acting horizontal component $P_H$ so that the resultant load acts at an angle at 30° with the vertical.

(d) For sailplanes with nose wheels the vertical load component $P_{VN}$ on the nose wheel in the attitude of sub-paragraph (a) (2) (i) of this paragraph must be computed as follows and must be combined with a rearward acting horizontal component according to sub-paragraph (c) of this paragraph taking into account JAR 22.725(a):

$$P_{VN} = 0.8 \times \frac{mg}{g}$$

where:

$m$ = mass of the sailplane (kg)
$g$ = acceleration of gravity (m/s$^2$).

[Ch. 4, 7.5.97]

JAR 22.481  Tail-down landing conditions

For design of tail skid and affected structure and empennage including balancing weight attachment, the tail skid load in a tail down landing (main landing gear free from ground) must be calculated as follows:

$$P = 4mg \left( \frac{i_y^2}{i_y^2 + L^2} \right)$$

where:

$P$ = tail skid load (N)
$m$ = mass of the sailplane (kg)
$g$ = acceleration of gravity (m/s$^2$)
$i_y$ = radius of gyration of the sailplane (m)
$L$ = distance between tail skid and sailplane c.g. (m)

[Ch. 4, 7.5.97]

JAR 22.483  One-wheel landing condition

If the two wheels of a main landing gear arrangement are laterally separated (see ACJ 22.477, (1)) the conditions under JAR 22.479 (a)(2), (b) and (c) must be applied also to each wheel separately taking into account limiting effects of bank. In the absence of a more rational analysis the limit kinetic energy must be computed as follows:

$$A = \frac{1}{2} m_{red} V_v^2$$

where:

$m_{red} = m \frac{1}{1 + \frac{a^2}{i_x^2}}$

$V_v = $ rate of descent = 1.5 (m/s)
$m$ = mass of the sailplane (kg)
$a$ = half the track (m)
$i_x$ = radius of gyration of the sailplane (m)

[Ch. 4, 7.5.97]

JAR 22.485  Side load conditions

A side load acting on one side of the main landing gear (both from right and left) normal to the plane of symmetry at the centre of the contact area of the tyre or skid with the ground, must be assumed. The applied load is equal to 0.3 $P_V$ and must be combined with a vertical load of 0.5 $P_V$ where $P_V$ is the vertical load determined in accordance with JAR 22.473.
Subpart C

JAR 22.497 Tail skid impact

(a) Except as provided in (b), if the c.g. of the unloaded sailplane – in side view – is situated behind the ground contact area of the main landing gear, the rear portion of the fuselage, the tail skid and the empennage must be designed to withstand the loads arising when the tail landing gear is raised to its highest possible position, consistent with the main wheel remaining on the ground, and is then released and allowed to fall freely.

(b) If the c.g. in all loading conditions is situated behind the ground contact area of the main landing gear (a) need not be applied.

JAR 22.499 Supplementary conditions for nose wheels

In determining the ground loads on the nose wheel and affected supporting structures, and assuming that the shock absorber and tyre are in their static positions, the following conditions must be met:

(a) For forward loads, the limit force components at the axle must be:

(1) A vertical component of 2·25 times the static load on the wheel; and

(2) A forward component of 0·4 times the vertical component.

(b) For side loads, the limit force components at ground contact must be:

(1) A vertical component of 2·25 times the static load on the wheel; and

(2) A side component of 0·7 times the vertical component.

[J. Ch. 4, 7.5.97]

JAR 22.501 Wing-tip landing

There must be means to ensure that ground loads acting at the wing tips are adequately resisted. A limit load $T = 40$ daN must be assumed to act rearward at the point of contact of one wing-tip with the ground, in a direction parallel to the longitudinal axis of the sailplane, the yawing moment so generated must be balanced by side load $R$ at the tail skid/wheel or nose skid/wheel (see Figure 4).

[J. Ch. 4, 7.5.97]

$R = \frac{Tb}{2L}$

$\frac{b}{2}$
EMERGENCY LANDING CONDITIONS

JAR 22.561 General

(a) The sailplane although it may be damaged in emergency landing conditions must be designed as prescribed in this paragraph to protect each occupant under those conditions.

(b) The structure must be designed to give each occupant every reasonable chance of escaping serious injury in a crash landing when proper use is made of belts and harnesses provided for in the design, in the following conditions:

1. The occupant experiences, separately, ultimate inertia forces corresponding to the accelerations shown in the following:

<table>
<thead>
<tr>
<th>Direction</th>
<th>Acceleration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Upward</td>
<td>4.5 g</td>
</tr>
<tr>
<td>Forward</td>
<td>9.0 g</td>
</tr>
<tr>
<td>Sideward</td>
<td>3.0 g</td>
</tr>
<tr>
<td>Downward</td>
<td>4.5 g</td>
</tr>
</tbody>
</table>

2. An ultimate load of 6 times the weight of the sailplane acting rearwards and upwards at an angle of 45° to the longitudinal axis of the sailplane acts on the forward portion of the fuselage at the foremost point(s) suitable for the application of such a load.

(c) Each sailplane with a retractable landing gear must be designed to protect each occupant in a landing with wheel(s) retracted under the following conditions:

1. A downward ultimate inertia force corresponding to an acceleration of 3 g; and

2. A coefficient of friction of 0.5 at the ground.

(d) Except as provided in JAR 22.787, the supporting structure must be designed to restrain, under loads up to those specified in subparagraph (b)(1) of this paragraph each item of mass that could injure an occupant if it came loose in a minor crash landing.

(e) For a powered sailplane with the engine located behind and above the pilot’s seat, an ultimate inertia load of 15 g in the forward direction must be assumed.

TOWING AND LAUNCHING LOADS

JAR 22.581 Aerotowing

(a) The sailplane must be initially assumed to be in stabilized level flight at speed $V_T$ with a cable load acting at the launching hook in the following directions:

1. Horizontally forwards;
2. In plane of symmetry forwards and upwards at an angle of 20° with the horizontal;
3. In plane of symmetry forwards and downwards at an angle of 40° with the horizontal; and
4. Horizontally forwards and sidewards at an angle of 30° with the plane of symmetry.

(b) With the sailplane initially assumed to be subjected to the same conditions as specified in JAR 22.581(a), the cable load due to surging suddenly increases to $1.2 Q_{\text{nom}}$.

1. The resulting cable load increment must be balanced by linear and rotational inertia forces. These additional loads must be superimposed on those arising from the conditions of JAR 22.581(a).

2. $Q_{\text{nom}}$ is the rated ultimate strength of the towing cable (or weak link if employed). For the purpose of these requirements it must be assumed to be not less than 1.3 times the sailplane maximum weight and not less than 500 daN.

JAR 22.583 Winch-launching

(a) The sailplane must be initially assumed to be in level flight at speed $V_W$ with a cable load acting at the launching hook in a forward and downward direction at an angle ranging from 0° to 75° with the horizontal.

(b) The cable load must be determined as the lesser of the following two values:

1. $1.2 Q_{\text{nom}}$ as defined in JAR 22.581(b), or
2. The loads at which equilibrium is achieved, with either:
   i. The elevator fully deflected in upward direction, or
   ii. The wing at its maximum lift.

A horizontal inertia force may be assumed to complete the equilibrium of horizontal forces.
(c) In the conditions of JAR 22.583(a), a sudden increase of the cable load to the value of $1.2 Q_{\text{nom}}$ as defined in JAR 22.581(b), is assumed. The resulting incremental loads must be balanced by linear and rotational inertia forces.

**JAR 22.585 Strength of launching hook attachment**

(a) The launching hook attachment must be designed to carry a limit load of $1.5 Q_{\text{nom}}$, as defined in JAR 22.581(b), acting in the directions specified in JAR 22.581 and JAR 22.583.

(b) The launching hook attachment must be designed to carry a limit load equal to the maximum weight of the sailplane, acting at an angle of 90° to the plane of symmetry.

**OTHER LOADS**

**JAR 22.591 Rigging and de-rigging loads**

A rigging limit load of plus and minus twice the wing-tip reaction, determined when either a semi-span wing is simply supported at root and tip or when the complete wing is simply supported at the tips, where this would be representative of the rigging procedure, must be assumed to be applied at the wing tip and reacted by the wing when supported by a reaction and couple at the wing root.

[Ch. 4, 7.5.97]

**JAR 22.593 Hand forces at the horizontal tail surfaces**

A limit hand force of $3\%$ of the design maximum weight of the sailplane but not less than 15 daN must be assumed to act on either tip of the horizontal tail surface:

(a) in the vertical direction;

(b) in the horizontal direction, parallel to the longitudinal axis.

[Ch. 4, 7.5.97]

**JAR 22.595 Load on the attachment point of the parachute ripcord**

The attachment point for the parachute ripcord (if provided) must be designed for a limit load of 300 daN acting in all possible directions.

**JAR 22.597 Loads from single masses**

The attachment means for all single masses, which are part of the equipment of the sailplane, must be designed to withstand loads corresponding to the maximum design load factors to be expected from the established flight and ground loads.
JAR 22.601 General
The suitability of each questionable design detail and part having an important bearing on safety in operations must be established by test.

JAR 22.603 Materials
The suitability and durability of materials used for parts, the failure of which could adversely affect safety, must –
(a) be established by experience or tests; and
(b) meet approved specifications that ensure their having the strength and other properties assumed in the design data.

JAR 22.605 Fabrication methods
The methods of fabrication used must produce consistently sound structures. If a fabrication process (such as gluing, spot welding, heat-treating, or processing of plastic materials) requires close control to reach this objective, the process must be performed under an approved process specification.

JAR 22.607 Locking of connections
An approved means of locking must be provided on all connecting elements in the primary structure and in control and other mechanical systems which are essential to safe operation of the sailplane. In particular self-locking nuts may not be used in any bolt subject to rotation in operation, unless a non-friction locking device is used in addition to the self-locking device.

JAR 22.609 Protection of structure
Each part of the structure must –
(a) be suitably protected against deterioration or loss of strength in service due to any cause, including –
(1) weathering;
(2) corrosion; and
(3) abrasion; and
(b) have adequate provisions for ventilation and drainage.

JAR 22.611 Accessibility
Means must be provided to allow:
(a) inspection of principal structural elements and control systems;
(b) replacement of parts normally requiring replacement; and
(c) adjustment and lubrication as necessary for continued airworthiness.

The means of inspection must be practicable for the inspection intervals established for the item during certification. This must be stated in the Maintenance Manual required under JAR 22.1529.

IEM 22.611
The provision of access panels suitably located and in sufficient numbers to enable the proper inspection of structural elements, to allow inspection, adjustment and lubrication of critical parts of the control system, as necessary for continued airworthiness, and the replacement of parts as required, is an acceptable interpretation of, and means of compliance with JAR 22.611. ‘Inspection’ is meant to include daily and other periodic checks.

Where it is impracticable to provide means for direct visual inspection, nondestructive inspection aids or special inspection methods may be used to inspect structural elements, when the inspection can be shown to be effective, if such inspection aids are easily obtainable.

[Ch. 5, 28.10.95]

JAR 22.612 Provisions for rigging and de-rigging
The design of the sailplane must be such that during rigging and de-rigging by untrained persons, the probability of damage or permanent deformation, especially when this is not readily visible, is extremely remote. Incorrect assembly must be avoided by proper design provisions. It must be possible to inspect the sailplane easily for correct rigging.

JAR 22.613 Material strength properties and design values
(a) Material strength properties must be based on enough tests to establish design values on a statistical basis.
Subpart D

JAR 22.613 (continued)

(b) The design values must be chosen so that the probability of any structure being understrength because of material variations is extremely remote.

IEM 22.613 (b)  (Interpretative Material)

Material specifications should be those contained in documents accepted either specifically by the Authority or by having been prepared by an organisation or person which the Authority accepts has the necessary capabilities. In defining design properties these material specification values should be modified and/or extended as necessary by the constructor to take account of manufacturing practices (for example method of construction, forming, machining and subsequent heat treatment).

(c) Where the temperature attained in an essential component or structure in normal operating conditions has a significant effect on strength, that effect must be taken into account.

IEM 22.613 (c)

Temperatures up to 54°C are considered to correspond to normal operating conditions.

JAR 22.619  Special factors

(a) The factor of safety prescribed in JAR 22.303 must be multiplied by appropriate combinations of the special factors prescribed in JAR 22.621 through JAR 22.625, JAR 22.657, JAR 22.693 and JAR 22.619(b).

IEM 22.619(a)

Appropriate combinations of the special factors should include all those of the following appropriate to the part:

(1) the casting factor derived in accordance with JAR 22.621;

(2) the highest pertinent special factor prescribed in JAR 22.623, JAR 22.625, JAR 22.657, JAR 22.693 or JAR 22.619(b); and

(3) the two-hinge factor prescribed in JAR 22.625 (e).

(b) For each part of the structure not covered by JAR 22.621 through JAR 22.625, JAR 22.657 and JAR 22.693 but whose strength is

(1) uncertain;

(2) likely to deteriorate in service before normal replacement; or

(3) subject to appreciable variability because of uncertainties in manufacturing processes or inspection methods; the special factor must be chosen so that failure of the part due to inadequate strength is improbable.

JAR 22.621  Casting factors

For castings the strength of which is substantiated by at least one static test and which are inspected by visual methods, a casting factor of 2.0 must be applied. This factor may be reduced to 1.25 providing the reduction is substantiated by tests on not less than three sample castings and if these and all production castings are subjected to an approved visual and radiographic inspection or an approved equivalent non-destructive inspection method.

JAR 22.623  Bearing factors

(a) The factor of safety for bearings at bolted or pinned joints must be multiplied by a special factor of 2.0 to provide for:

(1) relative motion in operation; and

(2) joints with clearance (free fit) subject to pounding and/or vibration.

(b) For control surface hinges and control system joints, compliance with the factors prescribed in JAR 22.657 and JAR 22.693, respectively, meets sub-paragraph (a) of this paragraph.

JAR 22.625  Fitting factors

For each fitting (a part or terminal used to join one structural member to another), the following apply:

(a) For each fitting whose strength is not proven by limit and ultimate load tests in which actual stress conditions are simulated in the fitting and surrounding structures, a fitting factor of at least 1.15 must be applied to each part of –

(1) the fitting;

(2) the means of attachment; and

(3) the bearing on the joined members.

(b) No fitting factor need be used for joint designs based on comprehensive test data (such as continuous joints in metal plating, welded joints, and scarf joints in wood).
(c) For each integral fitting, the part must be treated as a fitting up to the point at which the section properties become typical of the member.

(d) For each seat, safety belt, and harness, its attachment to the structure must be shown, by analysis, tests, or both, to be able to withstand the inertia forces prescribed in JAR 22.561 multiplied by a fitting factor of 1.33.

(e) When using only two hinges at each control surface, or wing-flap, the safety factor for these hinges and the attached parts of the primary structure must be multiplied by a factor of 1.5.

**JAR 22.627 Fatigue strength**

The structure must be designed, as far as practicable, to avoid points of stress concentration where variable stresses above the fatigue limit are likely to occur in normal service.

**JAR 22.629 Flutter**

(a) The sailplane must be free from flutter, aerofoil divergence, and control reversal in each configuration and at each appropriate speed up to at least $V_D$. Sufficient damping must be available at any appropriate speed so that aeroelastic vibration dies away rapidly.

(b) Compliance with sub-paragraph (a) must be shown by:

1. a ground vibration test which includes an analysis and an evaluation of the established vibration modes and frequencies for the purpose of recognising combinations critical for flutter, either by:
   - an analytical method, which will determine any critical speed in the range up to $1.2V_D$, or
   - any other approved method.

2. systematic flight tests to induce flutter at speeds up to $V_{DF}$. These tests must show that a suitable margin of damping is available and that there is no rapid reduction of damping as $V_{DF}$ is approached.

3. flight tests to show that when approaching $V_{DF}$:
   - control effectiveness around all three axes is not decreasing in an unusually rapid manner, and
   - no signs of approaching aerofoil divergence of wings, tailplane and fuselage result from the trend of the static stabilities and trim conditions.

**CONTROL SURFACES**

**JAR 22.655 Installation**

(a) Movable control surfaces must be installed so that there is no interference between any surfaces or their bracings when one surface is held in any position and the others are operated through their full angular movement. This requirement must be met:

1. under limit load (positive or negative) conditions for all control surfaces through their full angular range; and
2. under limit load on the sailplane structure other than control surfaces.

(b) If an adjustable stabilizer is used, it must have stops that will limit its range of travel to that allowing safe flight and landing.

**JAR 22.657 Hinges**

(a) Control surface hinges, except ball and roller bearing hinges, must have a factor of safety of not less than 6.67 with respect to the ultimate bearing strength of the softest material used as a bearing.

(b) For ball or roller bearing hinges, the approved rating of the bearing may not be exceeded.

(c) Hinges must have enough strength and rigidity for loads parallel to the hinge line.

**JAR 22.659 Mass balance**

The supporting structure and the attachment of concentrated mass balance weights used on control surfaces must be designed for -

(a) 24g normal to the plane of the control surface;
(b) 12 g fore and aft; and
(c) 12 g parallel to the hinge line.
CONTROL SYSTEMS

JAR 22.671 General
Each control must operate easily, smoothly, and positively enough to allow proper performance of its functions.

JAR 22.675 Stops
(a) Each control system must have adjustable stops that positively limit the range of motion of each movable aerodynamic surface controlled by the system.
(b) Each stop must be located so that wear, slackness, or take-up adjustments will not adversely affect the control characteristics of the sailplane because of a change in the range of surface travel.
(c) Each stop must be able to withstand any loads corresponding to the design conditions for the control system.

JAR 22.677 Trim system
(a) Proper precautions must be taken to prevent inadvertent, improper, or abrupt trim tab operation. There must be means near the trim control to indicate to the pilot the direction of trim control movement relative to sailplane motion. In addition, there must be means to indicate to the pilot the position of the trim device with respect to the range of adjustment. This means must be visible to the pilot and must be located and designed to prevent confusion.
(b) Tab controls must be irreversible unless the tab is properly balanced and has no unsafe flutter characteristics. Irreversible tab systems must have adequate rigidity and reliability in the portion of the system from the tab to the attachment of the irreversible unit to the sailplane structure.

JAR 22.679 Control system locks
If there is a device to lock the control system on the ground, there must be means to –
(a) give unmistakable warning to the pilot when the lock is engaged; and
(b) prevent the lock from engaging in flight.

JAR 22.683 Operation tests
It must be shown by functional tests that the system designed to the loads specified in JAR 22.397 is free from:
(a) jamming;
(b) excessive friction; and
(c) excessive deflection;
when operating the controls from the cockpit.

JAR 22.685 Control system details
(a) Each detail of each control system must be designed and installed to prevent jamming, chafing, and interference from baggage, passengers, loose objects, or the freezing of moisture.
(b) There must be means in the cockpit to prevent the entry of foreign objects into places where they would jam the system.
(c) There must be means to prevent the slapping of cables or rods against other parts.
(d) Each element of the flight control system must have design features, or must be distinctively and permanently marked, to minimize the possibility of incorrect assembly that could result in malfunctioning of the control system.

AMC 22.685(d)
(1) An automatic connection device in each part of the primary pitch control system which is connected during the rigging of the sailplane is an acceptable means of compliance with this requirement. Means should be provided to guarantee the proper functioning of the primary pitch control system. Normally this should be provided by visual inspection.
(2) For the other control systems it should be shown that no hazardous situation can occur, due to restrictive movement or jamming of the control system, when a part of the control system is not connected during the rigging of the sailplane.
(e) In sailplanes certificated for aerobatic manoeuvres, where necessary the rudder pedals must be provided with loops to prevent the feet from slipping off the pedals.

[Ch. 4, 7.5.87]
JAR 22.687 Spring devices

The reliability of any spring device used in the control system must be established by tests simulating service conditions unless failure of the spring will not cause flutter or unsafe flight characteristics.

JAR 22.689 Cable systems

(a) Each cable, cable fitting, turnbuckle, splice, and pulley used must meet approved specifications. In addition –

(1) no cable smaller than 3 mm diameter may be used in primary control systems;

(2) each cable system must be designed so that there will be no hazardous change in cable tension throughout the range of travel under operating conditions and temperature variations; and

(3) there must be means for visual inspection at each fairlead, pulley, terminal, and turnbuckle. The need for this requirement may be waived when it can be shown that airworthiness will not be affected within the service life of these components.

(b) Each kind and size of pulley must correspond to the cable with which it is used. Each pulley must have closely fitted guards to prevent the cables from being misplaced or fouled, even when slack. Each pulley must lie in the plane passing through the cable so that the cable does not rub against the pulley flange.

AMC 22.689(b)

The inside diameter of the pulley groove should not be less than 300 times the diameter of each elemental strand.

(c) Fairleads must be installed so that they do not cause a change in cable direction of more than 3°, except where tests or experience indicate that a higher value would be satisfactory. The radius of curvature of fairleads must not be smaller than the radius of a pulley for the same cable.

(d) Turnbuckles must be attached to parts having angular motion in a manner that will positively prevent binding throughout the range of travel.

(e) Tab control cables are not part of the primary control system and may be less than 3 mm diameter in sailplanes that are safely controllable with the tabs in the most adverse positions.

JAR 22.693 Joints

Control system joints (in push-pull systems) that are subject to angular motion, except those in ball and roller bearing systems, must have a special factor of safety of not less than 3·33 with respect to the ultimate bearing strength of the softest material used as a bearing. This factor may be reduced to 2·0 for joints in cable control systems. For ball or roller bearings, the approved ratings may not be exceeded.

JAR 22.697 Wing-flap and air-brake controls

(a) Each wing-flap control must be designed so that, when the wing-flap has been placed in any position upon which compliance with the performance requirements of this Part is based, the wing-flap will not move from that position except when:

(1) the control is adjusted; or

(2) the wing-flap is moved by the automatic operation of a wing-flap load limiting device; or

(3) movement other than in accordance with (1) or (2) is demonstrated not to be hazardous.

(b) Each wing-flap and air brake must be designed to prevent inadvertent extension or movement. The pilot forces and the rate of movement at any approved flight speed must not be such as to impair the operating safety of the sailplane.

(c) The air brake or other drag increasing device necessary to show compliance with JAR 22.73 and/or JAR 22.75 must comply with the following:

(1) Where the device is divided into several parts, all parts must be operated by a single control.

(2) It must be possible to extend the device at any speed up to 1·05 $V_{NE}$ without causing structural damage and to retract the device at any speed up to $V_A$, with a hand force not exceeding 20 daN.

(3) The time required for extension as well as retraction of the device may not exceed 2 seconds.

[Ch. 4, 7.5.87; Ch. 5, 28.10.95]
JAR 22.699 Wing-flap position indicator

There must be means near the wing-flap control to indicate to the pilot the position of the wing-flaps during and after operation.

JAR 22.701 Wing-flap interconnection

The motion of wing-flaps on opposite sides of the plane of symmetry must be synchronized by a mechanical interconnection unless the sailplane has safe flight characteristics with the wing-flaps retracted on one side and extended on the other.

JAR 22.711 Release mechanisms

(a) Release mechanisms to be used for winch-launching must be so designed and installed as to release the towing cable automatically (i.e. to back-release) if the sailplane overruns the cable while it is carrying any appreciable load.

(b) The release mechanisms must be approved.

(c) It must be extremely improbable for bolts or other projections on the release mechanism itself or the structure surrounding the mechanism, including the landing gear, to foul the towing cable or its parachute.

(d) It must be shown that the release force will not exceed that prescribed in JAR 22.143(c) when a cable load $Q_{nom}$ is applied in any direction (see JAR 22.583), and that the release mechanism functions properly under any operating condition.

(e) The range of travel of the release lever in the cockpit, including free travel, must not exceed 120 mm.

(f) The release lever in the cockpit must be arranged and designed so that the pilot force as defined in JAR 22.143(c) can be easily applied.

(g) A visual inspection of the release mechanism must be easily possible.

[J. 4. 7.5.87]

JAR 22.713 Launching hook

Depending on the launching method(s) for which certification is requested, the sailplane must be fitted with one or more launching hooks complying with the following:

(a) Each hook to be used for aerotow launching must be –

JAR 22.713(a) (continued)

(1) Designed to minimise the possibility of inadvertent release, and;

(2) Installed as far forward as practicable towards the nose of the fuselage in order to minimise the possibility of dangerous upsets during aerotowing (see JAR 22.151(a)(3)) and to produce a nose-down pitching moment on the sailplane under the conditions of JAR 22.581 (a)(3), but with an angle of not more than 25°.

(b) Each hook to be used for winch and/or auto-tow launching must be equipped with a release device which is automatically activated when the sailplane overflies the towing winch or auto-tow vehicle.

(c) The release control system must be designed to actuate the release mechanism of each launching hook at the same time, where more than one launching hook is fitted.

[Ch. 5. 28.10.95]

LANDING GEAR

JAR 22.721 General

(a) The sailplane must be so designed that it can land on unprepared soft ground without endangering its occupants.

(b) Each sailplane fitted with retractable landing gear must be designed and constructed so that normal landings with the landing gear retracted are possible.

(c) The design of wheels, skids and tail skid and their installation must be such as to minimize the possibility of fouling by the towing cable.

(d) If the main landing gear consists only of one or more wheels, the sailplane must be equipped with mechanical braking devices, such as wheel brakes.

(e) A shock-absorbing element must be fitted to the tail skid.

JAR 22.723 Shock absorption test

The proof of sufficient shock absorption capacity must be determined by test.

IEM 22.723

Where the shock absorption characteristics are not essentially affected by the rate of
JAR-22

JAR 22.723 (continued)

Compression, static tests may be used, but where the characteristics are so affected dynamic tests should be done.

[Ch. 4, 7.5.87]

JAR 22.725 Level landing

(a) The shock absorbing elements (including tyres) must be capable of absorbing the kinetic energy developed in a landing without being fully depressed.

(b) The value of kinetic energy must be determined under the assumption that the weight of the sailplane corresponds to design maximum weight with a constant rate of descent of 1.5 m/s, wing lift balancing the weight of the sailplane.

(c) Under the assumption of (b) the c.g. acceleration must not exceed 4 g.

JAR 22.729 Retracting mechanism

(a) Each landing gear retracting mechanism and its supporting structure must be designed for the maximum flight load factors occurring with the gear retracted.

(b) For retractable landing gears it must be shown that extension and retraction of the landing gear are possible without difficulty up to \( V_{LO} \).

(c) A sailplane equipped with a non-manually operated landing gear must have an auxiliary means of extending the gear.

JAR 22.731 Wheels and tyres

(a) Each landing gear main wheel must be approved.

(b) The maximum limit load rating of each wheel must equal or exceed the maximum radial limit load determined under the applicable ground load requirements. Each individual wheel of twin and tandem landing gears must be designed to support 70% of the maximum allowable weight.

Cockpit Design

JAR 22.771 General

(a) The cockpit and its equipment must allow each pilot to perform his duties without unreasonable concentration or fatigue.

(b) A means must be provided to enable ballast provided in accordance with JAR 22.31(c) to be stowed safely in the sailplane.

JAR 22.773 Cockpit view

Each cockpit must be free from glare and reflections that could interfere with the pilot’s vision, and designed so that:

(a) the pilot’s vision is sufficiently extensive, clear and undistorted for safe operation; and

(b) each pilot is protected from the elements. Rain and icing may not unduly impair his view along the flight path in normal flight and during landing.

AMC 22.773(b)

Compliance with JAR 22.773(b) may be provided by the canopy having a suitable opening.

JAR 22.775 Windshields and windows

(a) Windshields and windows must be constructed of a material that will not result in serious injuries due to splintering.

AMC 22.775(a)

Windshields and windows made of synthetic resins are accepted as complying with this requirement.

(b) Windshields and side windows of the canopy must have a luminous transmittance value of at least 70% and must not significantly alter the natural colours.

[Ch. 4, 7.5.87; Ch. 5, 28.10.95]

JAR 22.777 Cockpit controls

(a) Each cockpit control must be located to provide convenient operation, and to prevent confusion and inadvertent operation.

IEM 22.777(a)

The preferred arrangement of the powerplant controls is, from left to right, carburettor heat or alternate air control (if required), power, propeller, and mixture control.

(b) The controls must be located and arranged so that the pilot, when strapped in his seat, has full and unrestricted movement of each control without interference from either his
clothing (including winter clothing) or from the cockpit structure. The pilot must be able to operate all the controls necessary for the safe operation of the aeroplane from the seat designated to be used for solo flying.

(c) In sailplanes with dual controls it must be possible to operate the following secondary controls from each of the two pilots’ seats –

(1) release mechanism;
(2) air brakes;
(3) wing-flaps;
(4) trim;
(5) opening and jettisoning device of the canopy;
(6) throttle lever.

IEM 22.777(c)

The need for a dual trim control may be waived when it is demonstrated that, with the trimmer in the most adverse position, the elevator control forces are sufficiently small and that there is no difficulty in control.

(d) Controls must maintain any desired position without requiring constant attention by the pilot(s), and must not tend to creep under system loads or vibration. A means of adjusting the freedom of operation of the throttle control during flight to achieve this, must be provided. Controls must have adequate strength to withstand the loads without failure or excessive deflection.

AMC 22.777(d)

Throttle control systems which have been demonstrated to have inherently constant friction levels throughout their life such as Bowden type push/pull cables, are accepted as providing an equivalent level of safety to that of a ‘means of adjusting the freedom of operation of the throttle control in flight’.

JAR 22.779 Motion and effect of cockpit controls

Cockpit controls must be designed so that they operate as follows:

<table>
<thead>
<tr>
<th>Controls</th>
<th>Motion and effect</th>
</tr>
</thead>
<tbody>
<tr>
<td>Aileron</td>
<td>right (clockwise) for right wing down</td>
</tr>
<tr>
<td>Elevator</td>
<td>rearward for nose up</td>

</tr>
<tr>
<td>Alternate air</td>
<td></td>
</tr>
</tbody>
</table>

[Ch. 1, 18.5.81; Ch. 5, 28.10.95]
JAR 22.780 Colour marking and arrangement of cockpit controls

Cockpit controls must be marked and located as follows:

<table>
<thead>
<tr>
<th>Control</th>
<th>Colour</th>
<th>Location</th>
</tr>
</thead>
<tbody>
<tr>
<td>Towing cable release</td>
<td>yellow</td>
<td>for left hand operation.</td>
</tr>
<tr>
<td>Air brakes</td>
<td>blue</td>
<td>for left hand operation, or, in the case of a two-seat sailplane between the two pilot positions.</td>
</tr>
<tr>
<td>Trimmer (longitudinal trim)</td>
<td>green</td>
<td>preferably for left hand operation. only</td>
</tr>
<tr>
<td>Canopy operating handle</td>
<td>white *</td>
<td>not prescribed.</td>
</tr>
<tr>
<td>Canopy jettison handle</td>
<td>red *</td>
<td>not prescribed but must be within easy reach</td>
</tr>
<tr>
<td>Other controls</td>
<td></td>
<td>to be clearly marked but not yellow, red</td>
</tr>
</tbody>
</table>

* If canopy opening and jettison are combined in one handle, the colour must be red.

IEM 22.780

When two controls are necessary to jettison the canopy and one of those is also used as the normal canopy opening control, its colour should be white with a red ring or band around the handle.

[Ch. 5, 28.10.95]

JAR 22.781 Cockpit control knob shape

The towing cable release control must be so designed to be capable of operation by a gloved hand exerting the force specified in JAR 22.143(c).

AMC 22.781

The control should take the form of a T-shaped handle.

[Ch. 5, 28.10.95]

JAR 22.785 Seats and safety harnesses

(a) Each seat and its supporting structure must be designed for an occupant weight in accordance with JAR 22.25(a)(2) and for the maximum load factors corresponding to the specified flight and ground conditions including the emergency landing conditions prescribed in JAR 22.561. Each seat and its supporting structure must also be designed to withstand the reaction to the load specified in JAR 22.397(b).

(b) Seats including cushions may not deform to such an extent that the pilot when subjected to loads corresponding to JAR 22.581 and JAR 22.583, is unable to reach the controls safely, or that the wrong controls are operated.

(c) Each seat in a sailplane must be designed so that an occupant is comfortably seated, whether he wears a parachute or not. The seat design must allow the accommodation of a parachute worn by an occupant.

(d) The strength of the safety harness must not be less than that following from the ultimate loads for the flight and ground load conditions and for the emergency landing conditions according to JAR 22.561(b) taking into account the geometry of the harness and seat arrangement.

(e) Each safety harness [installation must be designed so that each occupant is safely retained in his initial sitting or reclining position under any acceleration occurring in operation.

[f] Each seat and safety harness installation must be designed to give each occupant every reasonable chance of escaping serious injury under the conditions of JAR-22.561(b)(1).]
JAR 22.786 Protection from injury

(a) Rigid structural members or rigidly mounted items of equipment, must be padded where necessary to protect the occupant(s) from injury during minor crash conditions.

(b) Structural members, which by the nature of their size or shape are capable of piercing the instrument panel, must be designed or positioned such that injury to occupants is unlikely, under the conditions of JAR 22.561(b)(2).

[Ch. 4, 7.5.87]

JAR 22.787 Baggage compartment

(a) Each baggage compartment must be designed for its placarded maximum weight of contents and for the critical load distributions at the appropriate maximum load factors corresponding to the flight and ground load conditions of this Part.

(b) Means must be provided to protect occupants from injuries by movement of the contents of baggage compartments under an ultimate forward acceleration of 9-0 g.

[Ch. 4, 7.5.87]

JAR 22.788 Headrests

(a) A headrest must be provided to protect each occupant from rebound injuries in the event of a crash landing. It must be equipped with energy absorbent padding protected against wear and weathering encountered in normal operation. If an adjustable headrest is provided it must be capable of being positioned such that the point of head contact is at eye level.

(b) Each headrest must be so designed to minimize the possibility of clothing or the parachute becoming caught when bailing out.

(c) Each headrest in its most critical position must be designed for an ultimate load of at least 135 daN normal to a vertical plane which touches the contact point of the head.

(d) The width and design of the headrest must not unduly restrict vision from either seat.

IEM 22.788

a) If possible, the structure of the headrest should be integrated into the backrest of each seat.

b) Each headrest should be so designed that protection from injuries referred to in subparagraph a) is ensured for each occupant irrespective of whether or not a parachute is worn.

[Amdt. 6, 01.08.01]
JAR 22.807   Emergency exit

(a) The cockpit must be so designed that unimpeded and rapid escape in emergency situations during flight and on the ground is possible with the occupant wearing a parachute.

(b) The opening, and where appropriate jettisoning, of each canopy or emergency exit must not be prevented by the presence of the appropriate aerodynamic forces and/or the weight of the canopy at speeds up to \( V_{DF} \) or by jamming of the canopy with other parts of the sailplane. The canopy or emergency exit attachment fittings must be designed to permit easy jettisoning, where jettisoning is a necessary feature of the design.

(c) The opening system must be designed for simple and easy operation. It must function rapidly and be designed so that it can be operated by each occupant strapped in his seat and also from outside the cockpit.

(d) A canopy or emergency exit jettison system must be actuated by not more than two controls, either or both of which must remain in the open position. The canopy jettisoning controls must be capable of being operated with a pilot effort of between 5 and 15 daN. If two controls are used they must both move in the same sense to jettison the canopy. If there are controls for each pilot, both controls or sets of controls must move in the same sense. If a single control is used for jettisoning, it must be designed to minimise the risk of inadvertent or unintentional operation towards the jettison position.

(e) In order to enable the occupants to bail out under acceleration conditions, sufficiently strong cabin parts, or grab-handles, must be available and suitably located so that the occupants can lift themselves out of their seats and support themselves. These parts must be designed to an ultimate load of at least 200 daN in the anticipated direction of force application.

[Ch. 5, 28.10.95]

JAR 22.831   Ventilation

(a) The cockpit must be designed so as to afford suitable ventilation under normal flying conditions.

(b) Carbon monoxide concentration must not exceed one part per 20 000 parts air.

JAR 22.857   Electrical bonding

(a) Electrical continuity must be provided to prevent the existence of differences of potential between components of the powerplant including fuel and other tanks, and other significant parts of the powered sailplane which are electrically conductive.

(b) If the sailplane is equipped for winch or auto launching, electrical continuity must be provided between the metallic parts of the cable release mechanism and the control column.

(c) The cross-sectional area of bonding connectors, if made from copper, must not be less than 1.33 mm\(^2\).

[Ch. 4, 7.5.87]

JAR 22.881   Ground handling

There must be reliable carrying and lifting provisions for the sailplane.

JAR 22.883   Ground clearance

(a) There must be at least 0.10 m of ground clearance for the tailplane with the wing-tip touching the ground.

(b) With the wing-tip touching the ground, the associated aileron may not touch the ground when deflected fully down.

JAR 22.885   Fairings

Removable fairings must be positively attached to the structure.
JAR-22 Subpart E

Subpart E — Power-plant

GENERAL

JAR 22.901 Installation

(a) For the purpose of this JAR–22, the sailplane power-plant installation includes each component that—

(1) is necessary for propulsion; and

(2) affects the safety of the propulsive unit.

(b) The power-plant must be constructed, arranged and installed to—

(1) ensure safe operation; and

(2) be accessible for necessary inspections and maintenance.

[Ch. 4, 7.5.87]

JAR 22.902 Installation: sailplanes with retractable power-plants or propellers

Powered sailplanes with retractable power-plants or propellers must comply with the following:

(a) Retraction and extension must be possible without risk of damage and without the use of exceptional skill or effort or excessive time.

(b) It must be possible to secure the retraction (extension) mechanism in the extreme positions. There must be a means to inform the pilot that this mechanism is secured in the fully retracted or extended position.

(c) Any doors associated with extension and retraction must not impair extension and retraction and they must be restrained against spontaneous opening.

(d) The installation must be so designed as to prevent the heat of the engine from causing a fire or other hazardous condition.

(e) Fuel or lubricant must not discharge in dangerous quantities from the engine, its components or accessories, when the power-plant is in the retracted position and during extension and retraction.

JAR 22.903 Engines

(a) The engine must be type certificated or otherwise approved in accordance with Subpart H.

(b) Restarting of the engine in flight must be possible.

[Ch. 1, 18.5.81]

JAR 22.905 Propellers

The propeller must be type certificated or otherwise approved in accordance with Subpart J.

[Ch. 1, 18.5.81]

JAR 22.925 Propeller clearance

If an unshrouded propeller is to be installed, propeller clearances with the powered sailplane at maximum weight, with the most adverse c.g. and with the propeller in the most adverse pitch position, may not be less than the following:

(a) *Ground clearance.* There must be a clearance of at least 180 mm (for a powered sailplane with a nose-wheel landing gear) or 230 mm (for a powered sailplane with a tail-wheel landing gear) between the propeller and the ground, with the landing gear statically deflected and in the level attitude, normal take-off attitude or taxiing attitude, whichever is most critical. In addition, there must be positive clearance between the propeller and the ground in the level take-off attitude, with:

(1) the critical tyre completely deflated and the corresponding landing gear strut statically deflected; and

(2) the critical landing gear strut bottomed and the corresponding tyre statically deflected.

(b) *Structural clearance.* There must be:

(1) At least 25 mm radial clearance between the blade tips and the sailplane structure, plus any additional radial clearance necessary to prevent harmful vibration;

(2) At least 13 mm longitudinal clearance between the propeller blades or cuffs and stationary parts of the sailplane; and

(3) Positive clearance between other rotating parts of the propeller or spinner and stationary parts of the sailplane.

[Ch. 4, 7.5.87]
FUEL SYSTEM

JAR 22.951 General
(a) Each fuel system must be constructed and arranged to ensure a flow of fuel at a rate and pressure established for proper engine functioning under any normal operating condition.
(b) Each fuel system must be arranged so that no fuel pump can draw fuel from more than one tank at a time. Gravity feed systems may not supply fuel to the engine from more than one tank at a time, unless the air spaces are interconnected in a manner to ensure that all interconnected tanks feed equally.

JAR 22.955 Fuel flow
(a) Gravity systems. The fuel flow rate for gravity systems (main and reserve supply) must be 150% of the take-off fuel consumption of the engine.
(b) Pump systems. The fuel flow rate for each pump system (main and reserve supply) must be 125% of the take-off fuel consumption of the engine at the maximum power established for take-off.

JAR 22.959 Unusable fuel
The unusable fuel supply for each tank must be established as not less than that quantity at which the first evidence of malfunctioning occurs under the most adverse fuel feed conditions occurring during take-off, climb, approach and landing involving that tank.

JAR 22.963 Fuel tanks: general
(a) Each fuel tank must be able to withstand, without failure, the vibration, inertia, fluid and structural loads that it may be subjected to in operation.
(b) Each flexible fuel tank must be of an acceptable kind.

JAR 22.965 Fuel tank tests
(a) Each fuel tank must be able to withstand the following pressures without failure or leakage:
   (1) for each conventional metal tank and non-metallic tank with walls not supported by the sailplane structure, a pressure of 0.25 bar;
   (2) for each non-metallic tank with walls supported by the sailplane structure and constructed in an acceptable manner using acceptable basic tank material, and with actual or simulated support conditions, a pressure of 0.14 bar for the first tank of a specific design.

JAR 22.967 Fuel tank installation
(a) Each fuel tank must be supported so that the loads resulting from the weight of the fuel are not concentrated. In addition:
   (1) there must be pads, if necessary, to prevent chafing between each tank and its supports; and
   (2) materials employed for supporting the tank or padding the supporting members must be non-absorbent or treated to prevent the absorption of fuel.
(b) Each tank compartment must be ventilated and drained to prevent accumulation of flammable fluids and vapours. Each compartment adjacent to a tank must be treated in a similar manner.
(c) No fuel tank may be located on the engine side of the firewall. There must be at least 15 mm of clearance between the fuel tank and the firewall.
(d) If the fuel tank is installed in the personnel compartment, it must be demonstrated that adequate ventilation and drainage are provided, that the presence of the tank will in no way interfere with the operation of any part of the powered sailplane, or the normal movement of occupants, and that no leaking fuel will fall directly on to any occupant.
(e) Fuel system components which could cause leakage of fuel as a result of a wheels-up landing must be suitably protected from damage.

JAR 22.969 Fuel tank expansion space
Each fuel tank must have an expansion space of sufficient capacity, but of not less than 2% of the tank capacity, to prevent spillage of fuel onto the surfaces of the sailplane due to thermal expansion, sloping ground or any normal ground attitude or manoeuvre, unless the design of the venting system precludes such spillage. It must not be possible to fill the expansion space inadvertently with the powered sailplane in any normal ground attitude.
JAR 22.971 Fuel tank sump

(a) Each fuel tank must have a drainable sump with an effective capacity, in the normal ground and flight attitudes, of 0-10% of the tank capacity, or 120 cm³, whichever is the greater, unless –

(1) the fuel system has a sediment bowl or chamber that is accessible for drainage and has a capacity of 25 cm³;

(2) each fuel tank outlet is located so that, in the normal ground attitude, water will drain from all parts of the tank to the sediment bowl or chamber.

(b) The drainage system must be readily accessible and easy to drain.

(c) Each fuel system drain must have manual or automatic means for positive locking in the closed position.

JAR 22.973 Fuel tank filler connection

Fuel tank filler connections must be located outside personnel compartments, except where the fuel tank must be taken out of those compartments for refuelling. Spilled fuel must be prevented from entering the fuel tank compartment or any part of the powered sailplane other than the tank itself.

[Ch. 5, 28.10.95]

JAR 22.975 Fuel tank vents

Each fuel tank must be vented as close as practicable to the highest point of the tank installation, or from the top part of the expansion space where this is required to be provided. In addition:

(a) Each vent outlet must be located and constructed in a manner that minimizes the possibility of its being obstructed by ice or other foreign matter.

(b) Each vent must be constructed to prevent siphoning of fuel during normal operation.

(c) Each vent must discharge clear of the powered sailplane.

[Ch. 5, 28.10.95]

JAR 22.977 Fuel strainer or filter

(a) There must be a fuel filter between the fuel tank outlet and the carburettor inlet (or an engine driven fuel pump, if any).

(b) There must be a finger strainer with 3 to 6 meshes per cm at the outlet of each fuel tank. The length of each strainer must be at least twice the diameter of the fuel tank outlet.

(c) Each filter or strainer must be easily accessible for drainage and cleaning.

JAR 22.993 Fuel system lines and fittings

(a) Each fuel line must be installed and supported to prevent excessive vibration and to withstand loads due to fuel pressure and accelerated flight conditions.

(b) Each fuel line connected to components of the sailplane between which relative motion could exist must have provisions for flexibility.

(c) Each flexible hose must be approved or must be shown to be suitable for the particular application.

(d) Each fuel line and fitting in any area subject to engine fire conditions must be at least fire-resistant.

JAR 22.995 Fuel valves and controls

(a) There must be a means to allow the pilot to shut off rapidly in flight the fuel to the engine.

(b) No shut-off valve may be on the engine side of any firewall.

(c) The portion of the line between the fuel cock and the carburettor must be as short as possible.

(d) Each fuel cock must have either positive stops or ‘feel’ in the ‘on’ and ‘off’ positions.

OIL SYSTEM

JAR 22.1011 General

(a) If an engine is provided with an oil system, it must be capable of supplying the engine with an appropriate quantity of oil at a temperature not exceeding the maximum established as safe for continuous operation.
(b) Each oil system must have a usable capacity adequate for the endurance of the powered sailplane.

JAR 22.1013 Oil tanks

(a) Each oil tank must be installed to:
   (1) meet the requirements of JAR 22.967(a), (b) and (d); and
   (2) withstand any vibration, inertia and fluid loads expected in operation.

(b) The oil level must be easy to check without having to remove any cowling parts (with the exception of oil tank access covers) or to use any tools.

(c) If the oil tank is installed in the engine compartment it must be made of fireproof material.

JAR 22.1015 Oil tank tests

Oil tanks must be subjected to the tests specified in JAR 22.965 for fuel tanks, except that in the pressure tests a pressure of 0.35 bar must be applied.

JAR 22.1017 Oil lines and fittings

(a) Oil lines must comply with JAR 22.993 and each oil line and fitting must be made of fireproof material.

(b) Breather lines. Breather lines must be arranged so that:
   (1) condensed water vapour or oil that might freeze and obstruct the line cannot accumulate at any point;
   (2) the breather discharge will not constitute a fire hazard if foaming occurs or cause emitted oil to strike the pilot’s wind shields;
   (3) the breather does not discharge into the engine air induction system;
   (4) if the engine is retractable, there must be no discharge of oil from the breather line when the engine is completely retracted.

COOLING

JAR 22.1041 General

The power-plant cooling provisions must be able to maintain the temperatures of power-plant components and engine fluids within the temperature limit established by the engine constructor during all likely operating conditions.

JAR 22.1047 Cooling test procedure for reciprocating engine powered sailplanes

(a) To determine compliance with the requirement of JAR 22.1041, a cooling test must be carried out as follows:
   (1) Engine temperatures must be stabilized in flight with the engine at not less than 75% of maximum continuous power.
   (2) After temperatures have stabilized, a climb must be begun at the lowest practical altitude and continued for one minute with the engine at take-off power.
   (3) At the end of one minute, the climb must be continued at maximum continuous power for at least 5 minutes after the occurrence of the highest temperature recorded.

(b) The climb required in (a) must be conducted at a speed not more than the best rate-of-climb speed with maximum continuous power.

(c) The maximum anticipated air temperature (hot-day conditions) is 38°C at sea-level. Above sea-level, the temperature decreases with a temperature gradient of 6.5°C per 1 000 m altitude. If the tests are conducted under conditions deviating from this value, the recorded temperatures must be corrected according to (d), unless a more rational method is applied.

(d) The temperatures of the engine fluids and of the power-plant components (with the exception of cylinder barrels) must be corrected by adding to them the difference between the maximum ambient anticipated air temperature and the temperature of the ambient air at the time of the first occurrence of the maximum recorded component or fluid temperature.
INDUCTION SYSTEM

JAR 22.1091 Air induction

The air induction system for the engine must supply the air required by the engine under all likely operating conditions.

JAR 22.1093 Induction system icing protection

(a) Except as permitted by (b), each engine having a conventional venturi carburettor must be provided with a pre-heater capable, in air free of visible moisture at a temperature of –1°C, of increasing the intake air temperature by 50°C with the engine at 75% of maximum continuous power.

(b) Where the intake air is continuously heated, and it is demonstrated that the temperature rise is adequate, a pre-heater need not be provided.

JAR 22.1103 Induction system ducts

(a) Each induction system duct must have a drain to prevent the accumulation of fuel or moisture in the normal ground and flight attitudes. No drain may discharge where it will cause a fire hazard.

(b) Each duct connected to components between which relative motion could exist must have means for flexibility.

JAR 22.1105 Induction system screens

If induction system screens are used –

(a) each screen must be upstream of the carburettor;

(b) it must be impossible for fuel to strike the screen.

EXHAUST SYSTEM

JAR 22.1121 General

(a) The exhaust system must ensure safe disposal of exhaust gases without fire hazard or carbon monoxide contamination in any personnel compartment.

(b) Each exhaust system part with a surface hot enough to ignite flammable fluids or vapours must be located or shielded so that leakage from any system carrying flammable fluids or vapours will not result in a fire caused by impingement of the fluids or vapours on any part of the exhaust system, including shields for the exhaust system.

(c) Each exhaust system component must be separated by fireproof shields from adjacent flammable parts of the sailplane that are outside the engine compartment.

(d) No exhaust gases may discharge dangerously near any oil or fuel system drain.

(e) No exhaust gases may be discharged where they will cause a glare seriously affecting pilot vision at night.

(f) Each exhaust system component must be ventilated to prevent points of excessively high temperature.

JAR 22.1125 Exhaust manifold

(a) The exhaust manifold must be fireproof and corrosion-resistant, and must have means to prevent failure due to expansion by operating temperature.

(b) The exhaust manifold must be supported to withstand the vibration and inertia loads to which it may be subjected in normal operation.

(c) Parts of the manifold connected to components between which relative motion could exist must have means for flexibility.

POWER-PLANT CONTROLS AND ACCESSORIES

JAR 22.1141 General

The portion of each power-plant control located in the engine compartment that is required to be operated in the event of fire must be at least fire-resistant.

JAR 22.1145 Ignition switches

(a) Each ignition circuit must be independently switched, and must not require the operation of any other switch for it to be made operative.

(b) Ignition switches must be arranged and designed to prevent inadvertent operation.
(c) The ignition switch must not be used as the master switch for other circuits.

JAR 22.1149 Propeller speed and pitch controls

(a) Propeller speed and pitch must be limited to values that ensure safe operation under normal operating conditions.

[In addition -

(1) If there are propeller speed or pitch controls, their operation must not require undue attention or exceptional skill.

(2) For variable pitch propellers provisions must be made for a positive indication that

(i) the allowable pitch range for engine start; and

(ii) the take-off pitch position has been reached.]

(b) Propellers that cannot be controlled in flight must meet the following requirements:

(1) during take-off and initial climb at \( V_Y \), the propeller must limit the engine rotational speed at full throttle to a value not greater than the maximum allowable take-off rotational speed, and

(2) during a glide at \( V_{NE} \) with throttle closed or the engine inoperative, provided this has no detrimental effect on the engine, the propeller must not permit the engine to achieve a rotational speed greater than 110% of the maximum continuous speed.

(c) A propeller that can be controlled in flight but does not have constant speed controls must be so designed that –

(1) JAR 22.1149 (b) (1) is met with the lowest possible pitch selected, and

(2) JAR 22.1149(b) (2) is met with the highest possible pitch selected.

(d) A controllable pitch propeller with constant speed controls must comply with the following requirements:

(1) with the governor in operation, there must be a means to limit the maximum engine rotational speed to the maximum allowable take-off speed, and

(2) with the governor inoperative, there must be a means to limit the maximum engine rotational speed to 103% of the maximum allowable take-off speed with the propeller blades at the lowest possible pitch and the powered sailplane stationary with no wind.

[Amdt. 6, 01.08.01]

JAR 22.1163 Power-plant accessories

(a) Each engine-driven accessory must -

(1) be satisfactory for mounting on the engine concerned; and

(2) use the provisions on the engine for mounting.

(b) Electrical equipment subject to arcing or sparking must be installed to minimize the probability of contact with any flammable fluids or vapours that might be present in a free state.

JAR 22.1165 Engine ignition systems

(a) Each battery ignition system must be supplemented by a generator that is automatically available as an alternative source of electrical energy to allow continued engine operation if any battery becomes depleted.

(b) The capacity of the batteries and generators must be large enough to meet the simultaneous demands of the engine ignition system and the greatest demands of any other electrical system components that draw from the same source.

(c) There must be a means to warn the pilot if, while the engine is running, malfunctioning of any part of the electrical system is causing continuous discharge of any battery used for engine ignition.

POWER-PLANT FIRE PROTECTION

JAR 22.1191 Firewalls

(a) The engine must be isolated from the rest of the sailplane by a firewall, shroud or equivalent means.

(b) The firewall or shroud must be constructed so that no hazardous quantity of liquid, gas or flame can pass from the engine compartment to other parts of the sailplane.

(c) The firewall and shroud must be fireproof and protected against corrosion.
The following materials are accepted as fireproof, when used in firewalls or shrouds, without being tested -

1. Stainless steel sheet, 0.38 mm thick;
2. Mild steel sheet (coated with aluminium or otherwise protected against corrosion) 0.5 mm thick;
3. Steel or copper base alloy firewall fittings.

JAR 22.1193 Cowling and nacelle

(a) Each cowling must be constructed and supported so that it can resist any vibration, inertia and air loads to which it may be subjected in operation.

(b) There must be a means for rapid and complete drainage of each part of the cowling in the normal ground and flight attitudes. No drain may discharge where it will cause a fire hazard.

(c) Cowling must be at least fire-resistant.

(d) Each part behind an opening in the engine compartment cowling must be at least fire-resistant for a distance of at least 600 mm aft of the opening.

(e) Each part of the cowling subjected to high temperatures due to its nearness to exhaust system ports or exhaust gas impingement, must be fireproof.
INTENTIONALLY LEFT BLANK
GENERAL

JAR 22.1301 Function and installation

(a) Each item of required equipment must:
   (1) be of a kind and design appropriate to its intended function;
   (2) be labelled as to its identification, function, or operating limitations, or any applicable combination of these factors;
   (3) be installed according to limitations specified for that equipment; and
   (4) function properly when installed.

IEM 22.1301(a)(4)

(1) The correct functioning should not be impaired by icing, heavy rain or high humidity.

(2) When ATC equipment is installed it should be shown that the electrical system is such that the operation of this equipment is not adversely affected.

(b) Instruments and other equipment may not in themselves, or by their effect upon the sailplane, constitute a hazard to safe operation.

JAR 22.1303 Flight and navigation instruments

The following are required flight and navigation instruments:

(a) For all sailplanes:
   (1) an air-speed indicator;
   (2) an altimeter.

( )

(b) For powered sailplanes. In addition to the instruments required in JAR 22.1303 (a):
   (1) a magnetic direction indicator.

(c) For sailplanes of Category A. In addition to the instruments required in JAR 22.1303 (a) and (b):
   (1) an accelerometer capable of retaining maximum and minimum values of acceleration for any selected period of flight.

[Amdt. 6, 01.08.01]

JAR 22.1305 Power-plant instruments

The following are the required power-plant instruments for powered sailplanes:

(a) a tachometer;

(b) a fuel quantity indicator for each fuel tank;

(c) an oil temperature indicator except for two stroke engines;

(d) an oil pressure indicator or warning device except for two stroke engines;

(e) a cylinder head temperature indicator for each air-cooled engine when cowl flaps are used;

(f) an elapsed-time indicator;

(g) an oil quantity indicator for each tank, e.g. dipstick.

[(h) a manifold pressure indicator for an engine equipped with a variable pitch propeller, where manifold pressure and rotational speed are independently controllable.]

[Amdt. 6, 01.08.01]

JAR 22.1307 Miscellaneous equipment

An approved safety harness must be available to each occupant.

INSTRUMENTS: INSTALLATION

JAR 22.1321 Arrangement and visibility

Flight and navigation instruments must be clearly arranged and plainly visible to each pilot.

AMC 22.1321

In order to comply with this requirement, duplication of the flight instruments may be necessary for sailplanes and powered sailplanes with dual control.

JAR 22.1322 Warning, caution, and advisory lights

If warning, caution, or advisory lights are installed in the cockpit, they must, unless otherwise approved by the Authority, be:
JAR 22.1322 (continued)

(a) Red, for warning lights (lights indicating a hazard which may require immediate corrective action);  
(b) Amber, for caution lights (lights indicating the possible need for future corrective action);  
(c) Green, for safe operation lights; and  
(d) any other colour, including white, for lights not described in sub-paragraphs (a) to (c) of this paragraph, provided the colour differs sufficiently from the colours prescribed in sub-paragraphs (a) to (c) of this paragraph to avoid possible confusion.  
(e) Effective under all probable cockpit lighting conditions.  

[Ch. 5, 28.10.95]

JAR 22.1323 Air-speed indicating system  
(a) The air-speed indicating system must be calibrated to indicate true air-speed at sea-level in standard atmosphere with a maximum pitot-static error not exceeding ± 8 km/h or ± 5% whichever is greater, throughout the following speed range 1·2 V S to V NE, and with wing-flaps neutral and air brakes closed.  
(b) Calibration must be made in flight.  
(c) The air-speed indicating system must be suitable for speeds between V S0 and at least 1·05 times V NE.

JAR 22.1325 Static pressure system  
(a) Each instrument provided with static pressure case connections must be so vented that the influence of sailplane speed and the opening and closing of windows, moisture or other foreign matter will not significantly affect the accuracy of the instruments.  
(b) The design and installation of a static pressure system must be such that:  
(1) positive drainage of moisture is provided;  
(2) chafing of the tubing, and excessive distortion or restriction at bends in the tubing, is avoided; and  
(3) the materials used are durable, suitable for the purpose intended, and protected against corrosion.

JAR 22.1327 Magnetic direction indicator  
(a) Each magnetic direction indicator required must be installed so that its accuracy is not excessively affected by the sailplane’s vibration or magnetic fields.  
(b) The compensated installation must not have a deviation in level flight, greater than 10° on any heading, except that when radio is in use or the engine of a powered sailplane is running, the deviation may exceed 10° but must not exceed 15°.

JAR 22.1337 Power-plant instruments  
(a) Instruments and instrument lines  
(1) Each power-plant instrument line must meet the requirements of JAR 22.993.  
(2) Each line carrying flammable fluids under pressure must have restricting orifices or other safety devices at the source of pressure to prevent the escape of excessive fluid if the line fails.  
(b) Each exposed sight gauge used as a fuel quantity indicator must be protected against damage.

JAR 22.1353 Storage battery design and installation  
(a) Each storage battery must be designed and installed as prescribed in this paragraph.  
(b) No explosive or toxic gases emitted by any battery in normal operation, or as the result of any probable malfunction in the charging system or battery installation, may accumulate in hazardous quantities within the sailplane.  
(c) No corrosive fluids or gases that may escape from the battery may damage surrounding structures or adjacent essential equipment.

JAR 22.1361 Master switch arrangement  
(a) In powered sailplanes there must be a master switch arrangement to allow ready disconnection of electric power sources from the main bus. The point of disconnection must be adjacent to the sources controlled by the switch.  
(b) The master switch or its controls must be so installed that the switch is easily discernible and accessible to the pilot.
JAR 22.1365 Electric cables and equipment

(a) Each electric connecting cable must be of adequate capacity and correctly routed, attached and connected so as to minimize the probability of short circuits and fire hazards.

(b) Overload protection must be provided for each electrical equipment. No protective device may protect more than one circuit essential to flight safety.

(c) Unless each cable installation from the battery to a circuit protective device or master switch, whichever is closer to the battery, is of such power-carrying capacity that no hazardous damage will occur in the event of a short circuit, this length of cable shall be so protected or routed in relation to parts of the powered sailplane that the risk of short circuit is minimised.

AMC 22.1365 (c)

This is normally achieved by limiting unprotected battery to master switch cables, of an adequate capacity, to a maximum length of 0.5 m.

In any event the capacities of protected cables should be such that no hazardous damage will occur to the powered sailplane, nor ill effects to the occupants from the generation of noxious fumes, due to electrical overloading of cables before a circuit protective device will operate.

[Ch. 5, 28.10.95]

JAR 22.1385 External lights

If external lights are to be installed they must be approved.

MISCELLANEOUS EQUIPMENT

JAR 22.1431 ATC airborne equipment

Each ATC airborne equipment provided must comply with the following:

(a) The equipment and its aerials may neither in themselves nor by their mode of operation or by their effect upon the operating characteristics of the sailplane and its equipment constitute a hazard to safe operation.

(b) The equipment and its control and monitoring devices must be arranged so as to be easily controllable. Their installation must be

JAR 11.1431(b) (continued)

such that they are sufficiently ventilated to prevent overheating.

JAR 22.1441 Oxygen equipment and supply

(a) Oxygen equipment must be approved.

(b) Oxygen equipment must be free from hazards in itself, in its method of operation, and its effect upon other components.

(c) There must be a means to allow the crew to readily determine, during the flight, the quantity of oxygen available in each source of supply.

(d) Oxygen bottles must be installed so as not to be hazardous in crash landings.

JAR 22.1449 Means for determining use of oxygen

There must be a means to allow the crew to determine whether oxygen is being delivered to the dispensing equipment.
JAR 22.1501 General

(a) Each operating limitation specified in JAR 22.1505 through JAR 22.1525 and other limitations and information necessary for safe operation must be established.

(b) The operating limitations and other information necessary for safe operation must be made available to the pilot as prescribed in JAR 22.1541 through JAR 22.1585.

[Ch. 4, 7.5.87]

JAR 22.1505 Air-speed limitations

(a) All flight speeds must be stated in terms of air-speed indicator readings (IAS).

IEM 22.1505(a)

Speeds (EAS) determined from structural limitations should be suitably converted.

(b) The never exceed speed, V_{NE}, must not exceed 0·90 times the maximum speed demonstrated in flight tests (V_{DF}).

(c) V_{DF} must not exceed the design maximum speed, V_{D} and must not be less than 0·9 times the design maximum speed according to JAR 22.335(f).

[Ch. 4, 7.5.87]

JAR 22.1507 Manoeuvring speed

The manoeuvring speed must not exceed the design manoeuvring speed, V_{A} as defined in JAR 22.335(a).

JAR 22.1511 Wing-flap operating speed

For each positive wing-flap position (see ACJ 22.335), the maximum wing-flap operating speed V_{FE} must not be greater than 0·95 times the speed V_{F} as defined in JAR 22.335(b) for which the structure has been designed.

[Ch. 4, 7.5.87]

JAR 22.1513 Powerplant extension and retraction speed

The flight speed range for extension and retraction of the powerplant must be established, together with any limitations associated with it.

[Ch. 5, 28.10.95]

JAR 22.1515 Landing gear operating speed

The maximum landing gear operating speed V_{LO}, if lower than the never exceed speed V_{NE}, must be established for retractable landing gear. It may, however, not be lower than V_{T} or V_{W}, whichever is greater.

JAR 22.1517 Rough air speed

The rough air speed, V_{RA} may not exceed the design gust speed in free flight V_{B} as defined in JAR 22.335(c).

JAR 22.1518 Aerotow and winch-launching speeds

(a) The maximum aerotow speed may not exceed the design speed V_{T} established in accordance with JAR 22.335(d) and may not exceed the speed demonstrated in flight tests.

(b) The maximum winch-launch speed may not exceed the design speed V_{W} established in accordance with JAR 22.335(e) and may not exceed the speed demonstrated in flight tests.

JAR 22.1519 Weight and c.g.

(a) The maximum weight determined under JAR 22.25(a) must be established as an operating limitation.

(b) The weight of non-lifting structural parts must be established.

(c) The c.g. limitations determined under JAR 22.23 must be established as operating limitations.

(d) The empty weight and the corresponding c.g. positions must be determined in accordance with JAR 22.29.
JAR 22.1521 Power-plant limitations

(a) General. The power-plant limitations prescribed in this paragraph must be established so that they do not exceed the corresponding limits for which the engine or propeller is type certificated.

(b) Take-off and continuous operation. The take-off and continuous operation must be limited by:

1. the maximum rotational speeds (r.p.m.);
2. the time limit for the use of take-off power;
3. the maximum allowable cylinder head, oil, and liquid coolant temperatures, as appropriate; and
4. the maximum allowable manifold pressure or any other parameter limiting the engine power if the engine is equipped with a continuously variable pitch propeller.

JAR 22.1523 Solo flight operation

The pilot’s seat for solo flight must be designated so that it is appropriate for safe operation, considering the accessibility of the controls that must be used by the solo pilot during all normal and emergency operations, when the pilot is seated at the designated seat station.

JAR 22.1525 Kinds of operation

The kinds of operation to which the sailplane is limited are established by the category in which it is eligible for certification and by the installed equipment.

JAR 22.1529 Maintenance manual

A maintenance manual containing the information that the applicant considers essential for proper maintenance must be provided. The applicant must consider at least the following in developing the essential information:

(a) description of systems;
(b) lubrication instructions setting forth the frequency and the lubricants and fluids which are to be used in the various systems;
(c) pressures and electrical loads applicable to the various systems;
(d) tolerances and adjustments necessary for proper functioning of the sailplane;
(e) methods of levelling, raising and ground towing;
(f) methods of balancing control surfaces, and maximum permissible values of play at hinge pins and control circuit backlash;
(g) allowed rigging tension in the cables of cable-operated control systems, as established according to JAR 22.411(b);
(h) identification of primary and secondary structures;
(i) frequency and extent of inspections necessary for proper maintenance of the sailplane;
(j) special repair methods applicable to the sailplane;
(k) special inspection techniques;
(l) list of special tools;
(m) rigging data necessary for the proper operation of the sailplane;
(n) statement of service life limitations (replacement or overhaul) of parts, components and accessories subject to such limitations, unless those limitations are given in documents referred to in (o);
(o) list of maintenance documents for parts, components and accessories approved independently of the sailplane;
(p) the materials necessary for small repairs;
(q) care and cleaning recommendations;
(r) instructions for rigging and de-rigging;
(s) information on supporting points for ground transport;
(t) list of placards and markings and their locations.
MARKINGS AND PLACARDS

JAR 22.1541 General

(a) The sailplane must contain –

(1) the markings and placards specified in JAR 22.1545 through JAR 22.1567; and

(2) any additional information, instrument markings, and placards required for the safe operation if it has unusual design, operating, or handling characteristics.

(b) Each marking and placard prescribed in sub-paragraph (a) of this paragraph –

(1) must be displayed in a conspicuous place; and

(2) may not be easily erased, disfigured, or obscured.

(c) The units of measurement used to indicate air speed on placards must be the same as those used on the indicator.

JAR 22.1543 Instrument markings – general

For each instrument:

(a) when markings are on the cover glass of the instrument, there must be means to maintain the correct alignment of the glass cover with the face of the dial; and

(b) each arc and line must be wide enough and located to be clearly visible to the pilot and not mask any portion of the dial.

JAR 22.1545 Air-speed indicator

Each air-speed indicator must show the following markings:

(a) For $V_{NE}$, a radial red line. If $V_{NE}$ varies with altitude, there must be a means to indicate to the pilot the appropriate limitations throughout the operating altitude range.

AMC 22.1545(a)

A placard located close to, or suitable markings on the face of, the airspeed indicator, giving reductions of $V_{a}$ with altitude, are acceptable means of compliance with the second sentence of this paragraph.

(b) for the upper caution range a yellow arc extending from $V_{NE}$ to the allowable rough-air speed $V_{RA}$.

(c) for the normal operating range, a green arc with the lower limit at 1.1 $V_{S1}$ with maximum weight and for wing-flaps neutral (see ACJ 22.335) and landing gear retracted and the upper limit at the rough-air speed $V_{RA}$.

(d) for the wing-flap operating range, a white arc with the lower limit at the stall speed 1.1 $V_{S0}$ for maximum weight and the upper limit at the allowable wing-flaps extended speed $V_{FE}$.

(e) a yellow marking (triangle) for the lowest approach speed (at maximum weight without water ballast) recommended by the manufacturer.

(f) for the best rate-of-climb speed $V_Y$ a blue radial line (for powered sailplanes only).

IEM 22.1545

An example of the presentation of an air-speed indicator complying with this requirement is shown in Figure 1.

[Ch. 4, 7.5.87; Ch. 5, 28.10.95]
FIGURE 1  EXAMPLE OF AIR SPEED INDICATOR MARKINGS

JAR 22.1547 Magnetic direction indicator

Unless the deviation is less than 5° on all headings, the deviation values for magnetic headings in not more than 30° increments must be placarded near the magnetic direction indicator.

JAR 22.1548 Accelerometer

Each accelerometer required by JAR 22.1303(c) must show red radial lines for the maximum positive and negative limit manoeuvring load factors.

JAR 22.1549 Power-plant instruments

For each required power-plant instrument, as appropriate to the type of instruments:
(a) each maximum and, if applicable, minimum safe operating limit must be marked with a red radial line;

(b) each normal operating range must be marked with a green arc, not extending beyond the maximum and minimum safe limits;
(c) each take-off and precautionary range must be marked with a yellow arc.
(d) in the case of digital solid state displays, limitations, precautionary and operating ranges required by sub-paragraphs (a), (b) and (c) of this paragraph must be clearly indicated. The display must be readable under all lighting conditions likely to be met in service.
In the case of digital solid state displays the required red line should be represented by a steady red light near or on the instrument, or by blinking of the whole display. The precautionary range should be indicated near or on the instrument. All instrument indications in that range should be designed to obtain the attention of the pilot. In addition, the operating range data should be placarded near the display using the colours described in JAR 22.1549 (a), (b) and (c).

Oil temperature, oil pressure and cylinder head temperature indications will be acceptable if achieved by means of warning lights instead of analogue or digital indications if:

1. The required red line is represented by a steady red light.
2. The normal operating range is represented by a steady green light.
3. The precautionary range is represented by a steady yellow light.
4. A 'press to test' facility is provided for the warning light displays.

[JAR 22.1549(d) (continued)]

Each fuel quantity indicator must be calibrated to read ‘zero’ during level flight when the quantity of fuel remaining in the tank is equal to the unusable quantity determined in accordance with JAR 22.959.

[JAR 22.1553 Fuel quantity indicator]

(a) Each cockpit control, other than primary flight controls, must be clearly marked as to its function and method of operation.

[IEM 22.1555(a)]

Identification of the controls should consist of easily understandable and commonly used symbols, such as those shown in Appendix G, in preference to placards.

(b) The colour markings of cockpit controls must be in accordance with those specified in JAR 22.780.

(c) for power-plant fuel controls:

1. Each fuel tank selector control must be marked to indicate the position corresponding to each tank.

[JAR 22.1555 Control markings]

(2) If safe operation requires the use of any tanks in a specific sequence, that sequence must be marked on or near the selector for those tanks.

[JAR 22.1557 Miscellaneous marking and placards]

(a) Baggage compartment. Each baggage compartment must have a placard stating the loading limitations.

(b) Fuel and oil filler openings. The following apply:

1. Fuel filler openings must be marked at or near the filler cover with the minimum fuel grade.
2. Oil filler openings must be marked at or near the filler cover:
   (i) with the grade; and
   (ii) if the oil is detergent or non-detergent.

(c) Fuel tanks. The usable fuel capacity of each tank must be marked either at the selector or on the gauge (when provided) or on the tank if this is translucent and visible to the pilot in flight.

(d) In-flight engine starting. A placard must be provided stating any limitations to be observed during in-flight engine starting.

(e) Tyre pressure. In the case of sailplanes fitted with a landing wheel or wheels, the tyre pressure must be marked on or in the sailplane.

(f) Aerobatic manoeuvres. A list of permissible aerobatic manoeuvres, including spins, must be placarded in each sailplane, so that it is plainly visible to the pilot.

(g) If removable ballast is used, the place for carrying ballast must have a placard stating instructions for the proper placement of the removable ballast under each loading condition for which each removable ballast is necessary.

[Ch. 5, 28.10.95]

The following additional data must be placarded in each sailplane so that they are plainly visible to the pilot:

(a) maximum weight;

(b) maximum and minimum cockpit load.

[Ch. 4, 7.5.87; Ch. 5, 28.10.95]
JAR 22.1559 Removed

[Amdt. 6, 01.08.01]

JAR 22.1561 Safety equipment

Each attachment point for an occupant's parachute static line must be marked red.

[JAR 22.1563 Airspeed placards ]

The following speeds, if they are not marked on the air-speed indicator, must be placarded in each sailplane or powered sailplane so that they are plainly visible to the pilot:

(a) the maximum winch-launching speed, \( V_W \) (when winch-launching is allowed);

(b) the maximum aerotow speed, \( V_T \) (when aerotow is allowed);

(c) the manoeuvring speed;

(d) the maximum landing gear operating speed, \( V_{LO} \), where applicable;

(e) the powerplant extension and retraction speeds \( V_{PO \text{ min}} \) and \( V_{PO \text{ max}} \), where applicable.

[Ch. 5, 28.10.95; Amdt. 6, 01.08.01]

JAR 22.1581 General

(a) Furnishing Information. A Flight Manual must be furnished with each sailplane. There must be an appropriate location for stowage of the Flight Manual aboard the sailplane and each Flight Manual must contain the following:

(1) Information required in JAR 22.1583 through JAR 22.1589 including the explanations necessary for their proper use and the significance of the symbols used.

(2) Other information that is necessary for safe operation because of design, operating or handling characteristics.

(3) A list of effective pages, with identification of those containing approved information according to sub-paragraph (b).

(b) Approved information. Each part of the Flight Manual containing information prescribed in JAR 22.1583 through JAR 22.1587 (a) must be limited to such information and must be approved, identified, and clearly distinguished from each other part of the Flight Manual. All manual material must be of a type that is not easily erased, disfigured, or misplaced and it must be in the form of individual sheets capable of being inserted in a manual provided by the applicant, or in a folder, or in any other permanent form.

(c) Units. The units of measurement used in the Flight Manual must be the same as those used on the indicators.

AMC 22.1581

An acceptable format for a Flight Manual is given in Appendix H.

The language required by the recipient airworthiness Authority for the Flight Manual is:

- Austria: German
- Belgium: One of the national languages of Belgium or English
- France: French
- Germany: German
- Italy: Italian, French or English
- Netherlands: Dutch, English or German
- Sweden: Swedish or English
- Switzerland: German or French
- United Kingdom: English

[Ch. 4, 7.5.87; Ch. 5, 28.10.95]

JAR 22.1583 Operating limitations

(a) Air-speed limitations. The following information must be furnished:

(1) Information necessary for the marking of the air-speed limits on the indicator as required in JAR 22.1545, and the significance of each of those limits and of the colour coding used on the indicator.

IEM 22.1583(a)

(1) For the purpose of explaining the significance of \( V_{RA} \), all air movements in lee-wave rotors, thunder-clouds, visible whirlwinds, or over mountain crests, are to be understood as rough air.
(2) The speeds $V_A$, $V_{LO}$, $V_T$, $V_W$ and $V_{PO}$ min and $V_{PO}$ max where appropriate, and their significance.

(b) Weights. The following information must be furnished:

(1) the maximum weight and the maximum weight of non-lifting parts. If the sailplane is equipped for expendable water-ballast, the maximum weight with and without water-ballast must be furnished.

(2) Any other weight limit, if necessary.

(c) Centre of gravity. The established c.g. limits required by JAR 22.23 must be furnished.

(d) Manoeuvres. Authorised manoeuvres established in accordance with JAR 22.3(a) or JAR 22.3(b), as appropriate, together with permissible ranges of wing-flap position must be stipulated.

(e) Flight load factors. Manoeuvring load factors; the following must be furnished:

(1) The factors corresponding to point A and point G of Figure 1 of JAR 22.333(b), stated to be applicable at $V_A$;

(2) The factors corresponding to point D and point E of Figure 1 of JAR 22.333(b), stated to be applicable at $V_{NE}$.

(3) The factor with airbrakes extended as specified in JAR 22.345.

(4) The factor with wing-flaps extended as specified in JAR 22.345.

(5) Markings in accordance with JAR 22.1548.

(f) (Unchanged)

(g) Aerotow, auto-tow and winch-launching. The following information on aerotowing, autotowing and winch-launching must be stated:

(1) the maximum permissible nominal strength for the towing cable or weak link;

(2) the minimum towing cable length established in accordance with JAR 22.151(d).

(h) Powerplant limitations. The following information must be furnished:

(1) Limitations required by JAR 22.1521.

(2) Information necessary for marking the instruments required by JAR 22.1549 through JAR 22.1553.
(g) The take-off distances in the conditions of JAR 22.51, unless classified as a Self-Sustaining Powered Sailplane, in which case there must be a statement in limitations section of the Flight Manual that the sailplane is not approved for take-off by sole means of its own power. In addition the statement must make clear which configurations are approved for launching.

(b) Special procedures to start the engine in flight, if necessary. The maximum demonstrated engine start density altitude, after a prolonged in flight shutdown, and the normal height loss to be expected during extension/unfeathering restart, and the achievement of minimum climb power, must be stated.

(i) For Self-Sustaining Powered Sailplanes, the maximum altitude that can be sustained.

(j) Information on the total quantity of usable fuel.

[(k) Advice to the pilot for correct adjustment and positioning of an adjustable headrest, if installed.]

[Ch. 5, 28.10.95; Amdt. 6, 01.08.01]

JAR 22.1587 Performance information

The following information must be furnished:

(a) Airspeed system calibration.

(b) The demonstrated crosswind velocity.

(c) Take-off performance versus density altitude [and the influence of other than smooth and hard surfaces.]

[Ch. 5, 28.10.95; Amdt. 6, 01.08.01]

JAR 22.1589 Loading information

The following loading information must be furnished:

(a) The empty weight and the position of the empty weight c.g.

(b) Instruction enabling the pilot of the sailplane to determine the water ballast load versus the useful load.

[Ch. 5, 28.10.95]
GENERAL

JAR 22.1801 Applicability

This Subpart H prescribes the requirements for the issue of type certificates or equivalent and changes to those certificates for spark-and compression-ignition engines for powered sailplanes.

AMC 22.1801

(a) When spark ignition is provided a single ignition system is acceptable.

(b) Engines certificated as aircraft engines are accepted as complying with this Subpart H.

JAR 22.1805 Instruction manual

An instruction manual containing the information that the applicant considers essential for installing, operating, servicing and maintaining the engine must be provided.

JAR 22.1807 Engine ratings and operating limitations

Engine ratings and operating limitations to be established are based on the operating conditions demonstrated during the bench tests prescribed in this Subpart H. They include power ratings and operational limitations relating to speeds, temperatures, pressures, fuels and oils which the applicant finds necessary for the safe operation of the engine.

JAR 22.1808 Selection of engine power ratings

Each selected rating must be for the lowest power that all engines of the same type may be expected to produce under the conditions to determine that rating.

DESIGN AND CONSTRUCTION

JAR 22.1815 Materials

The suitability and durability of materials used in the engine must –

(a) Be established on the basis of experience or tests; and

(b) Conform to approved specifications that ensure their having the strength and other properties assumed in the design data.

JAR 22.1817 Fire prevention

(a) The design and construction of the engine and the materials used must minimise the probability of the occurrence and spread of fire because of structural failure, overheating or other causes.

(b) Each external line or fitting that conveys flammable fluids must be at least fire resistant. Components must be shielded or located to safeguard against the ignition of leaking flammable fluid.

JAR 22.1819 Durability

Engine design and construction must minimise the probability of occurrence of an unsafe condition of the engine between overhauls.

JAR 22.1821 Engine cooling

Engine design and construction must provide the necessary cooling under conditions in which the powered sailplane is expected to operate.

JAR 22.1823 Engine mounting attachments and structure

(a) The maximum allowable loads for engine mounting attachments and related structure must be specified by the applicant.

IEM 22.1823 (a)

In choosing the maximum allowable loads, the applicant should take account of the flight and ground loads and the emergency alighting loads specified in JAR–22 for the sailplane as a whole.

(b) The engine mounting attachments and related structure must be able to withstand the specified loads without failure, malfunction or permanent deformation.
JAR 22.1825 Accessory attachment

Each accessory drive and mounting attachment must be designed and constructed so that the engine will operate properly with the accessories attached. The design of the engine must allow the examination, adjustment or removal of each essential engine accessory.

JAR 22.1833 Vibration

The engine must be designed and constructed to function throughout its normal operating range of crankshaft rotational speeds and engine powers without inducing excessive stress in any of the engine parts because of vibration and without imparting excessive vibration forces to the structure of the powered sailplane.

JAR 22.1835 Fuel and induction system

(a) The fuel system of the engine must be designed and constructed to supply the appropriate mixture of fuel to the combustion chambers throughout the complete operating range of the engine under all starting, flight and atmospheric conditions.

(b) The intake passages of the engine through which air, or fuel in combination with air, passes must be designed and constructed to minimise ice accretion and vapour condensation in those passages. The engine must be designed and constructed to permit the use of a means for ice prevention.

(c) The type and degree of fuel filtering necessary for protection of the engine fuel system against foreign particles in the fuel must be specified. The applicant must show (eg within the 50-hour run prescribed in JAR 22.1849 (a)) that foreign particles passing through the prescribed filtering means will not critically impair engine fuel system functioning.

(d) Each passage in the induction system that conducts a mixture of fuel and air, and in which fuel may accumulate, must be self-draining to prevent a liquid lock in the combustion chambers. This applies to all attitudes that the applicant establishes as those the engine can have when the powered sailplane in which it is installed is in the static ground attitude.

JAR 22.1839 Lubrication system (four-stroke engines only)

(a) The lubrication system of the engine must be designed and constructed so that it will function properly in all attitudes and atmospheric conditions in which the powered sailplane is expected to operate. In wet-sump engines this requirement must be met when the engine contains only the minimum oil quantity, the minimum quantity being not more than half the maximum quantity.

(b) The lubrication system of the engine must be designed and constructed to allow installing a means of cooling the lubricant.

(c) The crankcase must be vented to preclude leakage of oil from excessive pressure in the crankcase.

BENCH TESTS

JAR 22.1843 Vibration test

Except where the engine is of a type of construction known not to be prone to hazardous vibration, the engine must undergo a vibration survey to establish crankshaft torsional and bending characteristics over a range of rotational speeds from idling to 110% of the maximum continuous speed or 103% of the maximum desired take-off speed, whichever is the greater. The survey must be conducted with a representative propeller. No hazardous condition may be present.

IEMJ 22.1843

The propeller should be so chosen that the prescribed maximum rotational speed is obtained at full throttle or at the desired maximum permissible manifold pressure, whichever is appropriate.

JAR 22.1845 Calibration test

Each engine must be subjected to the calibration tests necessary to establish its power characteristics and the conditions for the endurance test specified in JAR 22.1849 (a) to (c). The results of the power characteristics calibration tests form the basis for establishing the characteristics of the engine over its entire operating range of crankshaft rotational speeds, manifold pressures, and fuel/air mixture settings. Power ratings are based on standard atmospheric conditions at sea-level.
JAR 22.1847 Detonation test (spark ignition only)

The engine must be tested to establish that it can function without detonation throughout the range of intended conditions of operation.

JAR 22.1849 Endurance test

(a) The engine must be subjected to an endurance test (with a representative propeller) that includes a total of 50 hours of operation and consists of the cycles specified in JAR 22.1849 (c).

(b) Additional endurance testing at particular rotational speed(s) may be required depending on the results of the tests prescribed in JAR 22.1843, to establish the ability of the engine to operate without fatigue failure.

(c) Each cycle must be conducted as follows:

<table>
<thead>
<tr>
<th>Sequence</th>
<th>Duration (Minutes)</th>
<th>Operating Conditions</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>5</td>
<td>Starting – Idle</td>

<td>Cooling run and stop</td>
</tr>
<tr>
<td>Total:</td>
<td>120</td>
<td></td>
</tr>
</tbody>
</table>

(d) During or following the endurance test the fuel and oil consumption must be determined.

JAR 22.1851 Operation test

The operation test must include the demonstration of backfire characteristics, starting, idling, acceleration, overspeeding and any other operational characteristics of the engine.

JAR 22.1853 Engine component test

(a) For engine components that cannot be adequately substantiated by endurance testing in accordance with JAR 22.1849 (a) to (c), the applicant must conduct additional tests to establish that components are able to function reliably in all normally anticipated flight and atmospheric conditions.

(b) Temperature limits must be established for each component that requires temperature controlling provisions to ensure satisfactory functioning, reliability and durability.

JAR 22.1855 Teardown inspection

After the endurance test has been completed the engine must be completely dis-assembled. No essential component may show rupture, cracks or excessive wear.

JAR 22.1857 Engine adjustment and parts replacement

The applicant may service and make minor repairs to the engine during the bench tests. If major repairs or replacements of parts is necessary during the tests or after the teardown inspection, or if essential parts have to be replaced, the engine must be subjected to any additional tests the certificating Authority may require.
GENERAL

JAR 22.1901 Applicability

This Subpart J prescribes the requirements for the issue of type certificates or equivalent and changes to those certificates for propellers for powered sailplanes.

AMC 22.1901

Propellers certificated as aircraft propellers are accepted as complying with this Subpart J.

JAR 22.1903 Instruction manual

An instruction manual containing the information that the applicant considers essential for installing, servicing and maintaining the propeller must be provided.

JAR 22.1905 Propeller operating limitations

Propeller operating limitations must be established on the basis of the conditions demonstrated during the tests specified in this Subpart J.

DESIGN AND CONSTRUCTION

JAR 22.1917 Materials

The suitability and durability of materials used in the propeller must –

(a) Be established on the basis of experience or tests; and

(b) Conform to approved specifications that ensure their having the strength and other properties assumed in the design data.

JAR 22.1919 Durability

Propeller design and construction must minimise the possibility of the occurrence of an unsafe condition of the propeller between overhauls.

JAR 22.1923 Pitch control

[ (a) ] Failure of the propeller pitch control may not cause hazardous overspeeding under intended operation conditions.

[ (b) ] If the propeller can be feathered the control system must be designed to minimize

1. Consequential hazards, such as a propeller runaway resulting from malfunction or failure of the control system

2. The possibility of an unintentional operation.

[Ammd. 6, 01.08.01]

TESTS AND INSPECTIONS

JAR 22.1933 General

The applicant must show that the propeller and its main accessories complete the tests and inspections prescribed in JAR 22.1935 through JAR 22.1947 without evidence of failure or malfunction.

JAR 22.1935 Blade retention test

The hub and blade retention arrangement of propellers with detachable blades must be subjected to a load equal to twice the centrifugal force occurring at the maximum rotational speed (other than transient overspeed) for which approval is sought, or the maximum governed rotational speed, as appropriate. This may be done either by a whirl test or a static pull test.

JAR 22.1937 Vibration load limit test

The vibration load limits of each metal hub and blade, and of each primary load-carrying metal component of non-metallic blades, must be determined for all reasonably foreseeable vibration load patterns.
JAR 22.1939 Endurance test

(a) Fixed-pitch or ground-adjustable wood or metal propellers. Fixed-pitch or ground-adjustable wood or metal propellers must be subjected to one of the following tests:

(1) A 50-hour flight test in level flight or in climb. At least five hours of this flight test must be with the propeller at the rated rotational speed and the remainder of the 50 hours must be with the propeller operated at not less than 90% of the rated rotational speed. This test must be conducted on a propeller of the greatest diameter for which certification is requested.

(2) A 50-hour endurance bench test on an engine at the power and propeller rotational speed for which certification is sought. This test must be conducted on a propeller of the greatest diameter for which certification is requested.

(b) Variable pitch propellers. Wood or metal variable pitch propellers (propellers the pitch of which can be changed by the pilot or by automatic means while the propeller is rotating) must be subjected to one of the following tests:

(1) A 50-hour test on an engine with the same power and rotational speed characteristics as the engine or engines with which the propeller is to be used. Each test must be made at the maximum continuous rotational speed and power rating of the propeller. If a take-off performance greater than the maximum continuous rating is to be established, an additional 10-hour bench test must be made at the maximum power and rotational speed for the take-off rating.

(2) Operation of the propeller throughout the engine endurance tests prescribed in Subpart H.

JAR 22.1941 Functional tests

(a) Each variable pitch propeller must be subjected to all applicable functional tests of this paragraph. The same propeller used in the endurance test must be used in the functional test and must be driven by an engine on a test stand or on a powered sailplane.

(b) Manually controllable propellers. 500 complete cycles of control throughout the pitch and rotational speed ranges, excluding the feathering range.

(c) Automatically controllable propellers. 1500 complete cycles of control throughout the

JAR 22.1945 Teardown inspection

After the endurance test has been completed the propeller must be completely dis-assembled. No essential component may show rupture, cracks or excessive wear.

JAR 22.1947 Propeller adjustments and parts replacement

The applicant may service and make minor repairs to the propeller during the tests. If major repairs or replacement of parts is found necessary during the tests or in the teardown inspection, any additional tests that the certificating Authority finds necessary must be conducted.

1.1 Introduction

The sailplane flight manual has been prepared to provide pilots and instructors with information for the safe and efficient operation of the ...................................... sailplane.

This manual includes the material required to be furnished to the pilot by JAR–22. It also contains supplemental data supplied by the sailplane manufacturer.

1.2 Certification basis

This type of sailplane has been approved by (responsible airworthiness authority) in accordance with JAR–22 including Amendment .................... and the Type Certificate No. ............. has been issued on (date) ...... Category of Airworthiness (Utility, Aerobatic) ..................................... Noise Certification Basis.................................

1.3 Warnings, cautions and notes

The following definitions apply to warnings, cautions and notes used in the flight manual.

WARNING : means that the non-observation of the corresponding procedure leads to an immediate or important degradation of the flight safety.

CAUTION : means that the non-observation of the corresponding procedure leads to a minor or to a more or less long term degradation of the flight safety.

NOTE : draws the attention on any special item not directly related to safety but which is important or unusual.

1.4 Descriptive data

2.1 Introduction

Section 2 includes operating limitations, instrument markings, and basic placards necessary for safe operation of the sailplane, its engine, standard systems and standard equipment.

The limitations included in this section and in Section 9 have been approved by (name of airworthiness authority).

2.2 Airspeed

Airspeed limitations and their operational significance are shown below:

<table>
<thead>
<tr>
<th>Speed</th>
<th>(IAS)</th>
<th>Remarks</th>
</tr>
</thead>
<tbody>
<tr>
<td>$V_{NE}$</td>
<td>Never exceed speed</td>
<td>Do not exceed this speed in any operation and do not use more than 0.1 of control deflection</td>
</tr>
<tr>
<td>$V_{RA}$</td>
<td>Rough air speed</td>
<td>Do not exceed this speed except in smooth air, and then only with caution. Examples of rough air are lee-wave rotor, thunderclouds etc.</td>
</tr>
<tr>
<td>$V_A$</td>
<td>Manoeuvring speed</td>
<td>Do not make full or abrupt control movement above this speed, because under certain conditions the sailplane may be overstressed by full control movement</td>
</tr>
<tr>
<td>$V_{FE}$</td>

2.6 **Mass (weight)**

Maximum take-off mass:
- (with water ballast)
- (without water ballast)

Maximum landing mass:

Maximum mass of all non-lifting parts:

Maximum mass in baggage compartment:

2.7 **Centre of gravity**

Centre of gravity range (for flight)

A table of c.g. ranges at different empty weights

Reference datum

2.8 **Approved manoeuvres**

This sailplane is certified in the ................. category.

(If aerobatic figures are approved, they must be listed herein with reference to Section 4 for recommended entry speeds).

2.9 **Manoeuvring load factors**

(Maximum positive and negative load factors under different conditions must be listed herein).

2.10 **Flight crew**

(In the case of a two-seater the limitations for solo flights must be given herein).

2.11 **Kinds of operation**

(Herein must be listed the approved kinds of operation according to JAR 22.1525).

2.12 **Minimum equipment**

(Herein must be listed the minimum equipment such as airspeed indicator, altimeter, compass etc. required for normal cross-country flights and the required additional equipment for cloud flying or aerobatic flights, if applicable).

2.13 **Aerotow and winch- and autotow-launching**

(Herein must be listed the approved towing speeds, the towing cable or weak link strength and the minimum cable length).

2.14 **Other limitations**

(Provide a statement of any limitation required by JAR 22.1581(c), but not specifically covered in this Section).

2.15 **Limitations placard**

(The operating limitations placard required in JAR 22.1559 shall be illustrated).

Note: For further placards refer to Maintenance Manual Doc. No.... Appr. 2.5]
Section 3

3. Emergency procedures

3.1 Introduction

3.2 Canopy jettison

3.3 Bailing out

3.4 Stall recovery

3.5 Spin recovery

3.6 Spiral dive recovery

3.7 Engine failure (carburettor icing)

3.8 Fire

3.9 Other emergencies
3.1 *Introduction*

Section 3 provides checklist and amplified procedures for coping with emergencies that may occur.

3.2 *Canopy jettison*

(Procedures shall be provided for jettisoning the canopy in an emergency).

3.3 *Bailing out*

(Procedures shall be provided for safely getting out and clear of the sailplane).

3.4 *Stall recovery*

(The stall recovery procedure shall be explained).

3.5 *Spin recovery*

(The recovery procedure from an unintentional spin shall be explained. A statement shall be included that the sailplane is not, or not in all configurations, approved for spins. If applicable, the influence of water-ballast should be taken into account).

3.6 *Spiral dive recovery*

(The recovery procedure from a spiral dive shall be explained. The influence of water-ballast should be taken into account).

3.7 *Engine failure*

(Procedures shall be provided for all cases of engine failure during take-off and flight, for powered sailplanes only).

3.8 *Fire*

(Procedures shall be provided for coping with cases of smoke or fire in the cockpit or in the engine compartment in the following flight phases:

(a) on the ground
(b) during take-off
(c) in flight).

3.9 *Other emergencies*

(Emergency procedures and other pertinent information necessary for safe operations shall be provided for emergencies peculiar to a particular sailplane design, operating or handling characteristics).

Appr. 3.2]
Section 4

4. Normal procedures
4.1 Introduction
4.2 Rigging and de-rigging
4.3 Daily inspection
4.4 Pre-flight inspection
4.5 Normal procedures and recommended speeds
4.5.1 Launch/engine starting, run up, taxiing procedures
4.5.2 Take-off and climb
4.5.3 Flight (including inflight engine stop/start procedures)
4.5.4 Approach
4.5.5 Landing
4.5.6 Flight with water ballast
4.5.7 High altitude flight
4.5.8 Flight in rain
4.5.9 Aerobatics
4.1 **Introduction**

Section 4 provides checklist and amplified procedures for the conduct of normal operation. Normal procedures associated with optional systems can be found in Section 9.

4.2 **Rigging and de-rigging.**

(The procedure for rigging and de-rigging shall be explained. Special attention shall be drawn to connections to be made in the control systems and the attachment points of wings and empennage).

4.3 **Daily inspection**

(The recommended daily inspection shall be explained)
(Note: The daily inspection could be continued in the Maintenance Manual but should primarily be in the Flight Manual, as it is related to pilot activity).

4.4 **Pre-flight inspection**

(The recommended pre-flight inspection shall be explained. Special attention shall be drawn to connections in the control systems and the attachment points of wing and empennage).

4.5 **Normal procedures and recommended speeds**

(This chapter shall contain the recommended normal procedures for the phases listed under 4.5.1 through 4.5.9 and the recommended air speeds, if applicable.

If take-off, flight and landing characteristics are different in rain this should be specially stated herein.

Under 4.5.3 shall be noted that flights in conditions conducive to lightning strikes must be avoided, unless the sailplane is approved for lightning strike conditions).
Section 5

5. Performance

5.1 Introduction

5.2 Approved data

5.2.1 Airspeed indicator system calibration

5.2.2 Stall speeds

5.2.3 Take-off performance

5.2.4 Additional information

5.3 Non-approved further information

5.3.1 Demonstrated crosswind performance

5.3.2 Flight polar

5.3.3 Noise data (for powered sailplanes only)
5.1 Introduction

Section 5 provides approved data for airspeed calibration, stall speeds and take-off performance and non-approved further information. The data in the charts has been computed from actual flight tests with the sailplane and engine in good condition and using average piloting techniques.

5.2 Approved data

5.2.1 Airspeed indicator system calibration

(The data shall be presented as Calibrated Airspeed (CAS) versus Indicated Airspeed (IAS) assuming zero instrument error. The presentation should include all flap setting configurations and should cover the appropriate speed operating range).

5.2.2 Stall speeds

(The data shall be presented as indicated airspeed versus flap setting configurations and angle of bank at maximum weight with and without water-ballast; in case of a powered sailplane, with throttle closed. Altitude loss of more than 30m and pitch below the horizon of more than 30 degrees during recovery from stalls should be added, if applicable).

5.2.3 Take-off performance

(For powered sailplanes take-off distances).

5.2.4 Additional Information (Information must be provided according to JAR 22.1581 (c))

5.3 Non-approved further information (In this section further information should be presented as follows:)

5.3.1 Demonstrated crosswind performance

(The maximum crosswind velocity at which take-offs and landings have been demonstrated should be presented together with the launching methods used).

5.3.2 Flight polar

(For sailplanes the rate-of-descent versus flight speed should be presented, including minimum descent speed and best angle of glide speed. For powered sailplanes additional data should be presented as endurance time versus altitude for various power settings and at least a full fuel loading with the engine running all the time).

5.3.3 Noise data (for powered sailplanes only)

(The certificated noise data shall be presented).
Section 6

6. Weight and balance

6.1 Introduction

6.2 Weight and Balance Record and permitted payload-range
6.1 **Introduction**

This Section contains the payload range within which the sailplane may be safely operated.

Procedures for weighing the sailplane and the calculation method for establishing the permitted payload range and a comprehensive list of all equipment available for this sailplane and the installed equipment during the weighing of the sailplane are contained in the applicable Maintenance Manual Doc. No. ..... .
### 6.2 Weight and Balance Record/permited payload range

EXAMPLE FOR A TANDEM SEATER

For calculation of the max. and min. crew + passenger weight refer to Maintenance Manual Doc. No......
Section 7

Note: The following is an example of items which may be included in this Section. Duplication of information is not necessary and should be avoided.

7. General sailplane and systems description
7.1 Introduction
7.2 Cockpit controls
7.3 Instrument panel
7.4 Landing gear system
7.5 Seats and safety harness
7.6 Pitot and static system
7.7 Air brake system
7.8 Baggage Compartment
7.9 Water ballast system
7.10 Powerplant
7.11 Fuel system
7.12 Electrical system
7.13 Miscellaneous equipment
7.1 **Introduction**

This Section provides description and operation of the sailplane and its systems. Refer to Section 9, Supplements, for details of optional systems and equipment.

7.2 **Cockpit controls**

(Describe the arrangement of the cockpit controls and their operating functions).

7.3 **Instrument panel**

(Provide a drawing or picture of the instrument panel. Identify the instruments, lights switches, circuit breakers and warning lights installed on the panel or in the cockpit).

7.4 **Landing gear system**

(Describe the system and explain the use of it).

7.5 **Seats and safety harness**

(Describe the adjustment of the seats, if applicable, and the safety harness installed).

7.6 **Pilot and static system**

(Describe the system with a good schematic).

7.7 **Airbrake System**

(Describe the kind of the system; airbrakes, flaps or brake-chutes and explain the use of it, if necessary).

7.8 **Baggage compartment**

(Describe location and tie-down provisions. Explain restrictions regarding weight and kind of baggage).

7.9 **Water-ballast system**

(Describe the system with a good schematic and explain the operation and anti-freeze recommendation).

7.10 **Powerplant**

(Describe the engine, the engine controls and instrumentation. Describe the propeller and explain how the propeller should operate).

7.11 **Fuel System**

(Describe the system with a good schematic and explain the operation. Explain unusable fuel. Explain the fuel measuring system and the fuel venting system. Explain the fuel/oil mixing method).

7.12 **Electrical system**

(Describe the system by use of simplified schematics. Explain how this system operates including warning and control devices. Explain circuit protections. Discuss battery capacity and load shedding).

7.13 **Miscellaneous equipment**

(Describe important equipment not already covered).
Section 8

8. Sailplane handling, care and maintenance

8.1 Introduction

8.2 Sailplane inspection periods

8.3 Sailplane alterations or repairs

8.4 Ground handling/road transport

8.5 Cleaning and care
8.1 Introduction

This Section contains manufacturer’s recommended procedures for proper ground handling and servicing of the sailplane. It also identifies certain inspection and maintenance requirements which must be followed if the sailplane is to retain that new-plane performance and dependability. It is wise to follow a planned schedule of lubrication and preventive maintenance based on climatic and flying conditions encountered.

8.2 Sailplane inspection period

(Reference to Maintenance Manual of the (powered) sailplane)

8.3 Sailplane alterations or repairs

It is essential that the responsible airworthiness Authority be contacted prior to any alterations on the sailplane to ensure that the airworthiness of the sailplane is not compromised.

For repairs refer to the applicable Maintenance Manual Doc. No.......  

8.4 Ground handling / road transport

(Describe the carrying and lifting provisions for the sailplane. Explain the following procedures, if applicable:

(a) Towing
(b) Parking
(c) Tie-down
(d) Preparing for road transport with special instructions for attaching the wings, fuselage and empennage in the transport vehicle, if appropriate).

8.5 Cleaning and care

(Describe cleaning procedures for at least the following aircraft items:

- canopy
- painted exterior surfaces (especially the leading edge of the wing)

and explain the recommended cleaning agents and give caution notes, if necessary).
Section 9

9. Supplements

9.1 Introduction

9.2 List of inserted supplements

9.3 Supplements inserted
9.1 Introduction

This Section contains the appropriate supplements necessary to safely and efficiently operate the sailplane when equipped with various optional systems and equipment not provided with the standard sailplane.

9.2 List of inserted supplements

<table>
<thead>
<tr>
<th>Date of Insertion</th>
<th>Doc. No.</th>
<th>Title of inserted supplement</th>
</tr>
</thead>
</table>

9.3 Supplements inserted

(Each supplement shall normally cover only a single system, device or piece of equipment such as a removable powerplant or an autopilot system. The supplement may be issued by the sailplane manufacturer or by any other manufacturer of the applicable item.

The supplement must be approved by the responsible airworthiness Authority and must contain all deviations and changes relative to the basic Flight Manual.

Each supplement shall be a self-contained, miniature Flight Manual with at least the following:

Section 1, General
The purpose of the Supplement and the system or equipment to which it specifically applies shall be stated.

Section 2, Limitations
Any change to the Limitations, markings or placards of the basic Flight Manual shall be stated. If there is no change, a statement to that effect shall be made.

Section 3, Emergency Procedures
Any addition or change to the basic emergency procedures of the Flight Manual shall be stated. If there is no change, a statement to that effect shall be made.

Section 4, Normal Procedures
Any addition or change to the basic normal procedures of the Flight Manual shall be stated. If there is no change, a statement to that effect shall be made.

Section 5, Performance
Any effect of the subject installation upon sailplane performance as shown in the basic Flight Manual shall be indicated. If there is no change, a statement to that effect shall be made.

Section 6, Weight and balance
Any effect of the subject installation upon weight and balance of the sailplane shall be indicated. If there is no change, a statement to that effect shall be made.
Appendix I
(see JAR 22.1(d))

SELF-SUSTAINING POWERED SAILPLANES

1. Engine conditions & speeds

   Two Conditions must be considered -

   (a) Engine extended and stopped (for cases related to engine idling).

   (b) Engine running at maximum power (for cases related to maximum continuous power, or all allowable power settings and also to JAR 22.175(d)(5)).

2. Structure

   JAR 22.361(a)(1) is not applicable.

3. Equipment

   JAR 22.1305 Power-plant instruments.

   (a) A tachometer or a suitable substitute -

      (1) A simple indication (eg a green light) that the engine is producing the power upon which the performance information is based; and

      (2) A simple indication (eg a red light) that the limiting engine r.p.m. has been reached except where it has been shown that the maximum engine r.p.m. cannot be exceeded at all speeds up to VNE.

   (b) A fuel quantity indicator for each fuel tank. The installation of a simple device, e.g. a transparent tank, a sight gauge or a floating type of indicator is acceptable.

   (c) An oil temperature indicator or an oil temperature warning device (red light). (Except for two-stroke engines).

   (d) An oil pressure indicator or warning device (red light). (Except for two-stroke engines).

   (e) A cylinder head temperature indicator or warning device (red light) for each air-cooled engine when cowl flaps are fitted.

   (f) An elapsed-engine-time indicator is not required.

   (g) An oil quantity indicator, eg. dipstick, unless the engine is a two-stroke type operating on pre-mixed fuel and oil.
Process of H-point determination

For the H-point determination, the thigh contact area and the seat level are the two reference areas in a cockpit.

a) Levelling the sailplane

The sailplane should be adjusted with the longitudinal axis horizontal and the wings level

b) Placing and adjusting of the device

With the thighs below the transitional area of seat level and thigh contact area, the device is placed in the centre of the thigh contact area. The device is then slowly pushed down to the thigh contact area until the two lower ends of the thighs touch the seat pan at the same time. This process should ensure that the thighs fully touch the thigh contact area at all times.

When both of the thighs have optimum contact with the thigh contact area or seat level, the device should be adjusted with the use of a spirit level until horizontal at the contact point and fixed in that position.

c) Marking of H-point and determination of optimum location of lap belt anchorage points

When the device is adjusted, the H-point device axis is pushed to one side until a felt-tip pen that is attached to the device touches the side wall of the seat pan. The H-point should be marked at this position. The same procedures should be repeated for the other side.

Continued adjustment of the device should enable the marking of the H-point for each adjusted position.

A rectangle should be drawn around all H-points marked on the side wall of the seat pan, which should be as small as possible. The intersecting point of the rectangle's diagonal shows the "determined H-point".

For the determination of optimum area for the anchorage point of the lap belts, the device is placed on the seat pan in such a way that the H-point of the device corresponds with the "determined H-point" of the seat pan.

The stencil should then be adjusted with the spirit level attached to it allowing the H-point axis to be fixed with the locking device in the connecting part. The area required for the anchorage point of the lap belt can then be identified on the stencil.
H-Point device

The device is basically composed of the two thighs, the connecting part, and the H-Point axis (see figure 1).

Figure 1

The original constructional drawing of the H-Point device can be ordered by
